Table 8-2 NCEEP Total Expected and Realized Savings by Year ..... 8-2

## 1. Executive Summary

This report is a summary of the evaluation effort of the 2014 and 2015 Imperial Irrigation District's (IID) energy efficiency (EE) programs. This evaluation was led by ADM Associates Inc. ("ADM", or "the Evaluators").

### 1.1 Summary of IID Energy Efficiency Programs

The evaluation includes the following programs:

- Energy Rewards Rebates;
- Weatherization;
- Quality AC Maintenance Program;
- Customer Energy Solutions Program; and
- New Construction Energy Efficiency Program.

### 1.2 Evaluation Activities

The evaluation includes:

- Calculation of energy and demand savings attributable to the 2014 and 2015 programs;
- A process evaluation of the programs to identify actionable information aimed at program improvements;
- Recommendations for future program years and
- An evaluation report that summarizes impact and process findings.

### 1.3 Impact Findings

Table 1-1 and Table 1-2 present the impacts by program. The values in this table are a comparison of the savings expected by the Imperial Irrigation District ("Expected Savings") and those verified by the Evaluators ("Verified Savings").

Table 1-1 Impact Summary for 2014

| Program | Annual Energy Savings (kWh) |  | Realization Rate | kW |  | Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| Energy Rewards (Residential) | 6,981,706 ${ }^{1}$ | 6,384,159 | 91.4\% | 1,771.59 | 3,636.67 | 205.3\% |
| Energy Rewards (Commercial) | 377,559 | 377,559 | 100.0\% | 128.68 | 128.68 | 100.0\% |
| Refrigerator Recycling | 82,306 | 82,306 | 100.0\% | 16.56 | 16.56 | 100.0\% |
| Quality AC Maintenance | 3,944,038 | 3,665,221 | 92.9\% | 2,038.19 | 3,114.65 | 152.8\% |
| Quality AC Maintenance | 4,037,651 | 4,037,651 | 100.0\% | 1,511.26 | 1,511.26 | 100.0\% |
| Custom Energy Solutions Program | 2,062,098 | 2,146,132 | 104.1\% | 468.73 | 323.56 | 69.0\% |
| New Construction Energy Efficiency Program | 1,375,372 | 1,431,420 | 104.1\% | 292.09 | 201.60 | 69.0\% |
| Total | 18,860,729 | 18,124,44 | 96.1\% | 6,210.53 | 8,932.97 | 143.5\% |

${ }^{1}$ Refrigerator and freezer recycling savings appear separately.

Table 1-2 Impact Summary for 2015

| Program | Annual Energy Savings (kWh) |  | Realization Rate | kW |  | Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| Energy Rewards Rebates (Residential) | 2,327,088 | 2,327,088 | 100.0\% | 6,780.67 | 1,370.97 | 20.2\% |
| Energy Rewards Rebates (Commercial) | 126,100 | 126,100 | 100.0\% | 104.68 | 104.68 | 100.0\% |
| Refrigerator Recycling | 126,793 | 126,793 | 100.0\% | 25.52 | 25.52 | 100.0\% |
| Weatherization | 487,366 | 474,541 | 97.4\% | 267.71 | 251.88 | 94.1\% |
| Quality AC Maintenance | 3,387,500 | 3,265,130 | 96.4\% | 2,277.69 | 2,538.12 | 111.4\% |
| Quality AC Maintenance Program (Commercial) | 425,268 | 425,268 | 100.0\% | 99.25 | 99.25 | 100.0\% |
| Custom Energy Solutions Program | 6,206,617 | 6,459,548 | 104.1\% | 292.09 | 201.60 | 69.0\% |
| New Construction Energy | 1,226,900 | 1,276,898 | 104.1\% | 141.75 | 97.85 | 69.0\% |
| Total | 14,313,632 | 14,481,366 | 101.2\% | 9,989.36 | 4,689.86 | 46.9\% |

While reviewing Custom Energy Solutions Program (CESP) and New Construction Energy Efficiency Program (NCEEP) IOMs the Evaluators found minor discrepancies between IOM kWh and kW totals and figures listed in E3 Tools, as well as one large NCEEP project whose savings appeared in CESP E3 totals. These discrepancies, shown below in Table 1-3 and Table 1-4, were discussed with IID staff. At the Evaluator's recommendation, CESP and NCEEP expected savings were adjusted to totals from IOMs and realizations rates were developed using these adjusted values.

Table 1-3 CESP Discrepancies

| Year | E3 kWh | IOM Total <br> kWh | kWh <br> Discrepancy | E3 $\boldsymbol{k W}$ | IOM <br> Total $\boldsymbol{k W}$ | $\boldsymbol{k W}$ <br> Discrepancy |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2014 | $2,844,305$ | $2,062,098$ | $(782,207)$ | 820.77 | 468.73 | $(352.05)$ |
| 2015 | $6,170,485$ | $6,206,617$ | 36,132 | $1,685.98$ | $1,703.57$ | 17.59 |

Table 1-4 NCEEP Discrepancies

| Year | E3 kWh | IOM Total <br> kWh | kWh <br> Discrepancy | E3 $\boldsymbol{k W}$ | IOM <br> Total $\boldsymbol{k W}$ | kW <br> Discrepancy |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2014 | 576,590 | $1,375,372$ | 798,783 | 315.67 | 292.09 | $(23.58)$ |
| 2015 | $1,123,872$ | $1,226,900$ | 103,028 | 131.87 | 141.75 | 9.88 |

### 1.4 Summary of Key Process Findings

ADM conducted in-depth telephone interviews with five IID staff members to gather information regarding 2014 and 2015 operational procedures and program delivery mechanisms. The interviews addressed five of the programs in IID's portfolio of energy efficiency programs. The interviews took place in April of 2018, during which time two
interviewees were affiliated with the programs but no longer are, and three of the interviewees are currently affiliated with the program but were not during the 2014 and 2015 program years. Therefore, extent to which staff could speak directly to program happenings that occurred during the evaluation period (2014-2015) was limited. For this reason, the interviews addressed high-level topics and previous year evaluation findings.

### 1.4.1 Overall Portfolio and Organization Findings

The following findings are related to multiple programs, to the IID portfolio of energy efficiency programs, or to IID's organizational structure and internal resources or procedures:

- Sufficient Organizational Resources: IID staff members stated that the organization has continued to transition resources over the past few years. Staff noted that during the 2014 and 2015 program years, several temporary employees were hired to assist with application review, approval, project tracking, and customer support. There was a consensus among staff members that in 2014 and 2015 management and operational resources were effective and sufficient for administering the portfolio of energy efficiency programs.
- In-house Application Processing: During the 2012 and 2013 program years, IID contracted with a $3^{\text {rd }}$ party for prescriptive rebate application processing, customer support, and QA/QC for some programs. Since that time, IID has transitioned all such program support activities back in-house according to program staff.
- Reduced Marketing in 2014 and 2015: Program staff indicated that during the 2014 and 2015 program years, program marketing was significantly reduced. Prior to 2014 IID took part in a variety of community outreach events, most of which were scaled back during 2014 and 2015. Interviewed staff also noted that marketing staff that were previously responsible to outreach activities were reassigned to new roles within IID during 2014.
- Omission of the Weatherization Program: The residential Weatherization Program was discontinued after the 2015 program year. ADM was unable to speak with any staff directly involved with program management during that time, however current staff indicated that the program was deemed not cost-effective. The program offered an energy audit and up to $\$ 1000$ of energy savings measures for a cost of $\$ 100$, which was often waived for income-qualified customers. Staff indicated that the realized energy savings compared to the high cost to run the program were consideration that led to the determination to terminate the program.
- Active Staff Engagement: Similar to previous evaluation period (2012-2013), it appears that IID actively responds to issues with program performance and operation. IID staff indicated that customer or contractor issues are frequently elevated to the board members and tend to be resolved effectively and efficiently. Board members and utility staff are especially interested in maintaining customer satisfaction and have modified program offerings to address customer and contractor feedback.
- Active Cross-program Outreach: As discovered in previous evaluations, the IID portfolio of energy efficiency programs incorporates cross-program outreach within its
outreach and program management procedures. All programs are listed on the IID website, with links to program applications, guidelines, and contact information. Additionally, IID uses energy assessments to direct customers towards relevant programs, and program staff actively inform participants of additional energy efficiency opportunities.
- Approved Contractor List is Mutually Beneficial: Staff noted that developing and maintaining an approved contractor list for attic insulation and HVAC contractors has been a success. Having an approved contractor list is useful for ensuring consistent work quality and procedures among projects and allows the utility to efficiently conduct outreach and training to active contractors. According to staff, contractors are pleased with the exposure gained from having their company on the program website and being affiliated with IID.

Key trends and findings identified for individual programs are discussed in respective individual program chapters.

### 1.5 Report Organization

This report is organized with one chapter providing the full impact and process summary for each specified program. The report is organized as follows:

- Chapter 2 provides general methodologies;
- Chapter 3 provides results for the Energy Rewards Program;
- Chapter 4 provides results for the Refrigerator Recycling Program;
- Chapter 5 provides results for the Weatherization Program;
- Chapter 6 provides results for the Quality AC Maintenance Program;
- Chapter 7 provides results for the Custom Energy Solutions Program;
- Chapter 8 provides results for the New Construction Program and
- Appendix B provides the site-level custom reports for sampled CESP and NCEEP sites.

## 2. Methodology

This section details general impact evaluation methodologies by program-type as well as data collection methods applied. This section will present full descriptions of:

- Savings Estimation;
- Sampling Methodologies;
- Process Evaluation Methodologies; and
- Data Collection Procedures.

### 2.1 Glossary of Terminology

As a first step to detailing the evaluation methodologies, the Evaluators provide a glossary of terms to follow ${ }^{2}$ :

- Ex ante - Forecasted savings used for program and portfolio planning purposes. Also referred to as "Expected Savings".
- Ex post - Savings estimates reported by an Evaluator after the energy impact evaluation has been completed. Also referred to as "Verified Savings".
- Deemed Savings - An estimate of an energy savings or demand savings for a single unit of an installed energy efficiency measure. This estimate (a) has been developed from data sources and analytical methods that are widely accepted for the measure and purpose and (b) is applicable to the situation being evaluated (e.g., assuming 112 kWh savings for a residential advanced power strip).
- Realization Rate - Ratio of Ex post Savings / Ex ante Savings (e.g., if the Evaluators verify 105 kWh per advanced power strip, Realization Rate = 105/112= 93.8\% realization rate).

### 2.2 Overview of Methodology

The proposed methodology for the evaluation of the IID programs is intended to provide:

- Impact results; and
- Program feedback and recommendations via process evaluation.

In doing so, this evaluation will provide the verified savings results, recommendations for program improvement, and ensure cost-effective use of ratepayer funds. Leveraging experience and lessons learned from impact evaluations can provide greater guidance as to methods by which program and portfolio performance could be improved.

### 2.2.1 Methodology for Estimating Savings for Standard Projects

The methodology used for estimating gross savings is described in this section.

[^0]
### 2.2.1.1 Desk Review

Savings for the majority of measures offered by IID programs are calculated by deemed kWh and kW figures from several sources: 2013-14 Database for Energy Efficient Resources (DEER 2013-14) deemed savings estimates, investor-owned utility (IOU) workpapers, KEMA reports and the Savings Estimation Technical Reference Manual for the California Municipal Utilities Association ("TRM") and independent publicly-available studies. The Evaluators reviewed program tracking data and savings sources listed in the E3 Tool for each measure. Deemed per-unit savings were verified against sources and assessed for reasonableness. If the Evaluators felt a more appropriate reputable savings source and figures were available for any measure, the ex post savings estimate was adjusted, and the source recommend.

Energy savings was calculated using the following savings algorithms:
Total kWh Savings $=$ Deemed per-unit savings number $X$ number of units rebated

### 2.2.2 Methodology for Estimating Savings CESP and NCEEP Programs

The CESP and NCEEP programs provide a combined $32.8 \%$ of evaluated savings, however due to their custom nature, they require and in-depth analysis. ADM selected a sample, conducted on-site measurement and verification and performed in-house custom analyses of each of the 19 sampled sites.
The main features of the approach used for the impact evaluation are as follows:

- Data for the study have been collected through review of program materials, on-site inspections, and end-use metering. Based on data provided by IID, sample designs were developed for on-site data collection for the impact evaluation. Sample sizes were determined that provide savings estimates for the program with $\pm 10 \%$ precision at the $90 \%$ confidence level.
- On-site visits were used to collect data for savings impacts calculations. The on-site visits were used to verify installations and to determine any changes to the operating parameters since the measures were first installed. Facility staff were interviewed to determine the operating hours of the installed system and to locate any additional benefits or shortcomings with the installed system.

### 2.2.2.1 Tracking Data Review and Sample Selection

IID provided program tracking data for CESP and NCEEP projects. The first step in the evaluation effort was to review this data and select a sample of sites to visit for verification and data collection.

Inspection of data on kWh savings for individual projects provided by IID indicated that the distribution of savings was generally positively skewed, with a relatively small number of projects accounting for a high percentage of the estimated savings. Estimation of savings for each program component is based on a ratio estimation procedure, which allows precision/confidence requirements to be met with a smaller sample size. Data provided by IID showed that during the period of January 2014 through December 2015, there were 112 Custom incentive projects for CESP and NCEEP programs, which were expected to provide a total savings of $10,870,987 \mathrm{kWh}$ and $2,606.08 \mathrm{~kW}$. ADM selected a sample with a sufficient number of projects to estimate the total achieved savings with
$10 \%$ precision at $90 \%$ confidence. For the Custom sample, the actual precision is $\pm 9.93 \%$.

### 2.2.2.1 CESP and NCEEP Program Sample Design

The participant population was divided into five strata. Table 2-1 summarizes the strata boundaries and sample frames for the CESP and NCEEP sample:

Table 2-1 CESP and NCEEP Programs Sample Design

|  | Stratum | Stratum | Stratum | Stratum | Stratum | Totals |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Strata boundaries $(\mathrm{kWh})$ | $<34,600$ | $34,601-$ | $110,001-$ | $270,001-$ | $>270,000$ |  |
| Number of projects |  | 110,000 | 270,000 | 700,000 |  |  |
| Total kWh savings | 59 | 22 | 21 | 7 | 3 | $\mathbf{4}$ |
| Average kWh Savings | 752,939 | $1,514,601$ | $3,315,40$ | $2,695,903$ | $2,592,141$ | $\mathbf{1 0 , 8 7 0 , 9 8 7}$ |
| Standard deviation of kWh | 12,762 | 68,846 | 157,876 | 385,129 | 864,047 | $\mathbf{9 7 , 0 6 2}$ |
| Coefficient of variation | 8,375 | 19,351 | 31,573 | 106,504 | 91,666 | $\mathbf{1 6 3 , 7 6 4}$ |
| Final design sample | 0.66 | 0.28 | 0.20 | 0.28 | 0.11 | $\mathbf{1 . 6 9}$ |

For each project, the available documentation (e.g., audit reports, savings calculation work papers, etc.) for each rebated measure was reviewed, with particular attention given to the calculation procedures and documentation for savings estimates. Documentation that was reviewed for all projects selected for the sample included program forms, data bases, reports, billing system data, weather data, and any other potentially useful data. Each application was reviewed to determine whether the following types of information had been provided:

- Documentation for the equipment changed, including (1) descriptions, (2) schematics, (3) performance data, and (4) other supporting information;
- Documentation for the new equipment installed, including (1) descriptions, (2) schematics, (3) performance data, and (4) other supporting information; and
- Information about the savings calculation methodology, including (1) what methodology was used, (2) specifications of assumptions and sources for these specifications, and (3) correctness of calculations.

### 2.2.2.2 On-Site Data Collection Procedures

On-site visits were used to collect data that were used in calculating savings impacts. The visits to the sites of the sampled projects were used to collect primary data on the facilities participating in the program. During on site visits ADM staff verified all rebated measures had been installed and operating as expected. Facility staff was interviewed about equipment schedules and loggers were placed to monitor lighting operation for approximately two weeks. These loggers were then removed and annual lighting hours of operation were extrapolated from their data.

### 2.2.2.1 Savings Calculations

The majority of sampled savings came from lighting measures.
Savings for lighting retrofits was calculated using the following algorithms:

$$
\begin{aligned}
k W h_{\text {savings }} & =\sum\left(\left[N_{\text {fixt }(i)} \times \frac{W_{\text {fixt }(i)}}{1000}\right]_{\text {pre }}-\left[N_{f i x t(i)} \times \frac{W_{\text {fixt }(i)}}{1000}\right]_{\text {post }}\right) \times A O H \times I E F_{E} \\
k W_{\text {savings }} & =\sum\left(\left[N_{f i x t(i)} \times \frac{W_{\text {fixt }(i)}}{1000}\right]_{\text {pre }}-\left[N_{\text {fixt }(i)} \times \frac{W_{\text {fixt }(i)}}{1000}\right]_{\text {post }}\right) \times C F \times I E F_{D}
\end{aligned}
$$

Where:
$N_{\text {fixt(i),pre }}=$ Pre-retrofit number of fixtures of type i
$N_{\text {fixt(i),post }}=$ Post-retrofit number of fixtures of type i
$W_{\text {fixt(i), pre }}=$ Rated wattage of pre-retrofit fixtures of type i
$W_{\text {fixt(i),post }}=$ Rated wattage of post-retrofit fixtures of type i
$C F=$ Peak demand coincidence factor ${ }^{3}$
$A O H=$ Annual operating hours for specified space type ${ }^{4}$
$I E F_{D}=$ Interactive effects factor for demand savings
$I E F_{E}=$ Interactive effects factor for energy savings

Inputs came from site documentation, primary data collected on site and values found in the Savings Estimation Technical Reference Manual for the California Municipal Utilities Association ("TRM").
Non-lighting savings calculations are discussed as needed in site reports.

### 2.2.2.1 Developing Program Realization

The realization rates from sampled sites within each stratum are then applied to the nonsampled sites within their respective stratum.

### 2.2.1 Methodology for Estimating Savings for the QACM Program

Most measures in the 2014 and 2015 Quality AC Maintenance Program (QACM) programs were analyzed by desk review ('Desk Review'). However, at the request of IID, two measures from the Duct Sealing (DTS) and Refrigerant Charge Adjustment (RCA) measures in single-family homes, were given and in-depth analysis. Savings algorithms are standard engineering savings algorithms taken from the Arkansas TRM 3.0. Measure inputs came from program tracking data and sources appropriate for the IID climate

[^1]region. Specific calculations and inputs are discussed in section 6 Quality AC Maintenance.

### 2.2.2 Process Evaluation

The Evaluator's general approach to process evaluation begins with a review of the tests for timing and appropriateness of process.

### 2.2.2.1 Staff Interviews

The evaluators intend to interview relevant utility staff members in order to obtain information regarding program design, implementation, and continued operation. Specific topics to be addressed during these interviews include performance of the program(s) thus far, changes in current program(s), a description of the day-to-day operation and a description of the participants. Overall, the program staff interviews are intended to be fairly open-ended discussions that may address topics other than those identified above. The content of these discussions is likely to fluctuate based on the specific program being discussed and the role of the specific staff member being interviewed. Topics discussed in program staff interviews include:

- Program goals and objectives;
- Marketing and outreach;
- Communication processes;
- Program management and staffing; and
- Quality control and verification processes.

### 2.2.2.1 Literature Reviews

The evaluators will conduct a comprehensive literature review of the program design and theory of the IID program portfolio. This review will serve to inform the history of program operation and implementation, along with general program characteristics, whether program design and implementation are in accordance with current best practices and whether there are opportunities to make program improvements addressing feedback obtained from in-depth interviews.

## 3. Energy Rewards

### 3.2 Program Description

The Energy Rewards Rebate Program is designed to provide standardized incentives to both residential and non-residential IID customers. The program offers incentives for a variety of measures, including attic insulation, lighting, motors, and HVAC equipment. Residential customers can choose their own contractor or self-install most measures; contractors installing attic insulation must be selected from IID's approved contractors list.

Qualifying equipment must replace old equipment with new, energy-efficient equipment. For non-residential customers the upgrades must meet and exceed Title 24 standards in effect at the time of installation.

The program offered 60 residential and 29 commercial measures. Figure 3-1 and Figure $3-2$ show the percentage of program savings they contributed by end use category.

Figure 3-1 Residential Savings Contribution by End Use

[^2]Figure 3-2 Commercial Savings Contribution by End Use

### 3.3 Impact Findings

Verified savings for all measures in both program years are summarized in Table 3-1 through Table 3-5:

Table 3-1 Residential Realization Summary 2014

| Measure | Annual Energy Savings (kWh) |  | kWh Realization Rate | Peak kW |  | kW <br> Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| Ceiling insulation, increase to R-30 | 36,040 | 29,553 | 82.0\% | - | 18.02 | N/A |
| Ceiling insulation, increase to R-38 | 3,694,124 | 3,103,064 | 84.0\% | - | 1,847.06 | N/A |
| Other Measures | 3,251,542 | 3,251,542 | 100.0\% | 1,771.59 | 1,771.59 | 100.0\% |
| Total | $\underset{5}{6,981,706}$ | 6,384,159 | 91.4\% | 1,771.59 | 3,636.67 | 205.3\% |

Table 3-2 Residential Realization Summary 2015

| Measure | Annual Energy <br> Savings (kWh) |  | kWh <br> Realization <br> Rate | Peak kW |  | $k W$ <br> Realization <br> Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Verified | Rater |  |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| 2014 | 377,559 | 377,559 | 100.0\% | 128.68 | 128.68 | 100.0\% |
| 2015 | 126,100 | 126,100 | 100.0\% | 104.68 | 104.68 | 100.0\% |
| Total | 503,658 | 503,658 | 100.0\% | 233.36 | 233.36 | 100.0\% |

Table 3-4 Combined Realization Summary 2014

| Measure | Annual Energy Savings (kWh) |  | kWh <br> Realization Rate | Peak kW |  | kW <br> Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| Residential | 7,064,012 | 6,384,159 | 91.4\% | 1,771.59 | 3,636.67 | 205.3\% |
| Commercial | 377,559 | 377,559 | 100.0\% | 128.68 | 128.68 | 100.0\% |
| Total | 7,359,265 | 6,761,718 | 91.9\% | 1,900.26 | 3,765.34 | 198.1\% |

Table 3-5 Combined Realization Summary 2015

| Measure | Annual Energy Savings (kWh) |  | kWh <br> Realization Rate | Peak kW |  | kW <br> Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| Residential | 2,453,881 | 2,453,881 | 100.0\% | 6,806.19 | 1,396.48 | 20.5\% |
| Commercial | 126,100 | 126,100 | 100.0\% | 104.68 | 104.68 | 100.0\% |
| Total | 2,579,981 | 2,579,981 | 100.0\% | 6,910.87 | 1,501.17 | 21.7\% |

Two 2014 measures' savings estimates were adjusted: ‘Ceiling insulation, increase to R30 ' and 'increase to R-38' were adjusted from $2.00 \mathrm{kWh} /$ square foot in the E3 Tool to 1.64 and $1.68 \mathrm{kWh} /$ square foot in accordance with the TRM. This resulted in $82.0 \%$ and $84.0 \%$ kWh realization rates for the respective measures and a $91.5 \% \mathrm{kWh}$ realization rate for the 2014 residential overall. Also, the E3 Tool did not attribute any peak kW savings to these measures, however a $0.001 \mathrm{~kW} /$ square foot savings for these measures is appropriate and accounted for in ex post savings estimates, raising the overall 2014 kW residential realization rate to $205.3 \%$.

Two 2015 insulation measures' kW savings estimates were also adjusted: In the E3 Tool 'Ceiling insulation, R-38 (baseline: no insulation)' and 'existing plus new insulation' are assumed to provide a peak kW reduction of 0.106 and $0.1 \mathrm{~kW} /$ square foot, respectively. Peak kW values appropriate for these measures are closer to $0.001 \mathrm{~kW} /$ square foot. The Evaluators adjusted ex post savings estimates accordingly, decreasing measure realization rates to $0.9 \%$ and $1.0 \%$, respectively, and overall residential kW realization to 20.5\%

All other measures' savings estimates were found to be appropriate and thus no further adjustments were made.

### 3.4 Process Findings

- Few Program Changes: Staff indicated that from a program design perspective, very few changes were made to the Energy Rewards Rebate Program during the 2014 and 2015 program years. The maximum incentive is $50 \%$ of the net purchase price. This requirement is in place to maintain program cost-effectiveness and to manage freeridership potential by preventing customers from receiving incentives for measures that have already been incentivized by another source. Customers are still encouraged to use an approved contractor for attic insulation and HVAC measures.

Staff noted that if a customer applies for an attic insulation or HVAC incentive, which was not associated with an approved contractor, the payment will not be denied so as not to penalize the customer. Staff will notify the customer of the approved contractor list should they decide to do a future project, and staff will also reach out the contractor to elicit their enrollment in the program. The contractor will be notified that should the contractor opt not to enroll as a participating contractor, future rebate applications payable to the contractor may be denied.

- Sufficient Trade Ally Training and Engagement: Having an approved contractor list is useful for ensuring consistent work quality and procedures among projects and allows the utility to efficiently conduct outreach and training to active contractors. The decision to require an approved contractor for attic insulation and HVAC installation in the Energy Rewards Program was an appropriate and important response to widespread program issues during the 2012 and 2013 program years and will likely minimize future contractor issues.
- Significant Decrease in Attic Insulation from 2014 to 2015: Staff noted several reasons for this shift in program activity most notable was the decreased incentive from $\$ .60 /$ sqft to $\$ .30 /$ sqft. Initially, the higher incentive attracted a flood of contractors to pursue insulation projects in IID's territory, staff indicated that in 2014 they were receiving up to one hundred applications a day. After a thorough review of other regional programs, of similar design, it was determined that the incentive could be lowered and still encourage installation of this measure type. Staff indicated that once the incentive amount was adjusted, it was much more in-line with other regional programs, activity slowed to a much more manageable pace.
- Approximately Six Weeks for Application Processing: Staff described the application submission and review process. Once the measure is purchased and installed the customer can apply for a rebate through completing an application and
submitting required documentation. IID customers access the program application via IID's website or pay stations throughout the service territory and submit in-person, via fax or US mail. Program staff review the application for completeness, ensures the customer has not participated in the past, validates that the invoice lists the rebated measure(s), and inputs all customer and measure information into an excel spreadsheet. After which time the applications go into the "request for check" stage and are processed in batches.

All applications are reviewed by management, finance, and sent to accounting for processing. Staff indicated that all applications that request rebate dollars more than $\$ 2500$ are flagged for pre-approval, which requires and additional level of review. Staff indicated the application review and approval process take approximately eight to ten weeks.

- Consistent Quality Assurance Procedures: During the 2014 and 2015 program years, as with previous program years, the Energy Rewards Rebate Program outlines specific requirements for program participation, staff provided insight into the processes through which they ensure participants are meeting those requirements. IID staff review all applications for completeness and eligibility, ensuring the applicant is an IID account holder, that they have not applied for a similar incentive in the past five years, and that all proof of purchase/invoices are submitted. IID staff conduct onsite inspections for approximately 15\% of all submitted rebate applications. Staff noted that they tend to focus on projects for which the estimation of square footage is required. The inspection parameters are measure specific and include, but are not limited to, verification of square footage, verification of installation quantities, and that the units are connected and in working condition. Inspectors will also take pictures on site and draft an inspection report upon completion.
- Opportunity to Improve Current Program Tracking System: Program staff noted that the current system used to track program activity is a series of custom excel spreadsheets. This process collects the necessary information to track program activity and associated energy savings but limits the ease with which staff edit project information, check project status, and run custom reports. Staff indicated that a more advanced relational database would be useful for online submission, searching for applications status, and running custom reports as needed.
- Strong Internal Communication: Staff did not describe regularly scheduled communication regarding program activity, rather they described more informal daily communication that is sufficient for supporting the administration and oversight needs of the program.

### 3.5 Recommendations

ADM provides the following recommendations for consideration:

- Replace CFL Measures with LEDs: LEDs provide greater kWh and kW savings and EULs than CFLs while maintaining the same lumen outputs. LED lighting costs have declined as the market matured and with the relaxation of the longevity standards
under ENERGY STAR 2.0 guidelines. Additionally, ENERGY STAR certified lighting has largely transitioned from CFLs to LEDs ${ }^{6}$.

[^4]
## 4. Refrigerator Recycling

### 4.1 Program Description

Refrigerator and freezer recycling measures were part of the Energy Rewards Program through 2014 but were developed into a standalone program starting in 2015. The program is designed to remove old refrigerators and freezers from use by offering IID customers a $\$ 50$ rebate for recycling the item through the Appliance Recycling Centers of America.

Figure 4-1 Savings Contribution by Appliance Type

### 4.2 Impact Findings

Table 4-1 Weatherization Expected and Realized Savings 2015

| Measure | Annual Energy Savings (kWh) |  | kWh Realization Rate | Peak kW |  | kW Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| $2014{ }^{7}$ | 82,306 | 82,306 | 100.0\% | 16.56 | 16.56 | 100.0\% |
| 2015 | 126,793 | 126,793 | 100.0\% | 25.52 | 25.52 | 100.0\% |
| Total | 209,099 | 209,099 | 100.0\% | 42.08 | 42.08 | 100.0\% |

The Evaluators determined that all savings estimates were reasonable and did not warrant any adjustments, resulting in $100 \% \mathrm{kWh}$ and kW realization rates.

[^5]
## 5. Weatherization

### 5.1 Program Description

The Residential Weatherization Program was designed to provide residential IID customers with an inspection of their home's energy usage and with a variety of energy efficiency measures including CFLs, occupancy sensors, shade screens, ceiling insulation, and building shell improvements. Participating customers paid \$100 to participate in the program, which provided an energy audit and up to a total of \$1,000 of measures and weatherization services. The Weatherization Program is not exclusively targeted towards income-qualified customers, although the $\$ 100$ co-pay is waived for customers who qualify for IID low income discounts through the Residential Energy Assistance Program (REAP).

In 2015, IID contracted with Synergy for program implementation services and according to program staff the Weatherization Program was discontinued at the end of 2015.

The program offered 16 residential measures. Figure 5-1 shows the percentage of program savings they contributed by measure type.

Figure 5-1 Savings Contribution by End Use

### 5.2 Impact Findings

Table 5-1 Weatherization Expected and Realized Savings 2015

| Measure | Annual Energy Savings (kWh) |  | kWh <br> Realization Rate | Peak kW |  | kW <br> Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| 18 Watt CFL Exterior Fixture | 16,960 | 9,268 | 54.6\% | 1.48 | - | 0.0\% |
| 36 Watt CFL Exterior Fixture | 14,350 | 9,218 | 64.2\% | 14.35 | - | 0.0\% |
| Other Measures | 456,056 | 456,056 | 100.0\% | 251.88 | 251.88 | 100.0\% |
| Total | 487,366 | 474,541 | 97.4\% | 267.71 | 251.88 | 94.1\% |

The Evaluators determined that two measures involving the replacement of outdoor incandescent lamps with CFL was premised on a higher reduction in connected load that was appropriate given EISA lumen equivalence tables. Additionally, since these fixtures operate outdoors during non-daylight hours, not during any peak demand periods, thus no peak kW savings can be observed from them. Ex post savings estimates were adjusted down for these two measures. Savings estimates for all other measures were found to be reasonable, resulting in $97.4 \% \mathrm{kWh}$ and $94.1 \% \mathrm{~kW}$ for the program overall.

### 5.3 Process Findings

- Program Marketing and Outreach: IID staff noted that promotion of the Weatherization Program was mainly conducted by Synergy, the program implementation contractor. Synergy marketed the program using IID's logo and conducted various outreach tasks including the onsite audit and installation visits.
- Concurrent Participation in Gas Program: During 2015, both IID and the gas utility offered separate weatherization programs, and customers receiving service from both companies were eligible to participate in both programs concurrently. The distribution of measures between programs depended on the type of heating and water heating in the home. This helped to ensure that IID was not implementing measures that would not generate electric savings, and that program resources were allocated effectively.
- Customer Engagement and Interest: IID staff noted that in 2015, like 2012 and 2013, the majority of interest in the Weatherization Program has been from incomequalified customers who also participate in REAP and customer interested in installing residential solar. Staff noted that many residential solar projects first require an extensive energy audit prior to array installation, therefore the audit component of the Weatherization Program became a vehicle for the required audit.

## 6. Quality AC Maintenance

The Quality A/C Maintenance (QACM) Program is designed to provide both residential and commercial customers with air conditioning services including duct testing and sealing, refrigerant charging, detailed equipment inspection, and cleaning of the unit. Renters are eligible to receive services through the program if the owner of their building completes the program consent form that is provided during the equipment assessment.

Enalasys serves as the program implementation contractor, and recruits contractors to deliver program services. Once a customer applies to the program, Enalasys schedules an assessment appointment in order to evaluate the customer's air conditioner maintenance needs. The AC maintenance services are provided at no additional cost to the customer.

Figure 6-1 Residential Savings Contribution by End Use

Figure 6-2 Commercial Savings Contribution by End Use

### 6.1 M\&V Methodology

Savings algorithms are standard engineering savings algorithms taken from the Arkansas TRM 3.0. Measure inputs came from program tracking data and sources appropriate for the IID climate region. Unless otherwise noted, specific input values and source are listed below in Table 6-1 and Table 6-2.

### 6.1.1 Duct Sealing Savings Calculations

A sample of 2,368 single family homes was used to develop average test-in and test-out data, as well as average system tonnage and other parameters.

### 6.1.1.1 Cooling Savings (Electric):

$$
k W h_{\text {savings }, C}=\frac{\left(D L_{\text {pre }}-D L_{\text {post }}\right) \times E F L H_{\text {Cooling }} x\left(h_{\text {out }} \rho_{\text {out }}-h_{\text {in }} \rho_{\text {in }}\right) \times 60}{1,000 \times S E E R}
$$

Where:
$D L_{\text {pre }}=$ Pre-improvement duct leakage at $25 \mathrm{~Pa}\left(\mathrm{ft}^{3} / \mathrm{min}\right)$
$D L_{\text {post }}=$ Post-improvement duct leakage at $25 \mathrm{~Pa}\left(\mathrm{ft}^{3} / \mathrm{min}\right)$
$E F L H_{\text {cooling }}=$ Equivalent Full Load Hours
$h_{\text {out }}=$ Outdoor design specific enthalpy $(\mathrm{Btu} / \mathrm{lb})$
$h_{\text {in }}=$ Indoor design specific enthalpy $(\mathrm{Btu} / \mathrm{lb})$
$\rho_{\text {out }}=$ Density of outdoor air at $95^{\circ} \mathrm{F}=0.0740(\mathrm{lb} / \mathrm{ft} 3)^{8}$
$\rho_{\text {in }}=$ Density of conditioned air at $75^{\circ} \mathrm{F}=0.0756(\mathrm{lb} . / \mathrm{ft} 3)^{9}$
$60=$ Constant to convert from minutes to hours
$1,000=$ Constant to convert from W to kW
$S E E R=$ Seasonal Energy Efficiency Ratio of existing system (Btu/W $\cdot \mathrm{hr})$

### 6.1.1.2 Heating Savings (Heat Pump):

$$
k W h_{\text {savings }, H}=\frac{\left(D L_{\text {pre }}-D L_{\text {post }}\right) \times 60 \times H D D \times 24 \times 0.018}{1,000 \times H S P F}
$$

Where:
$D L_{\text {pre }}=$ Pre-improvement duct leakage at $25 \mathrm{~Pa}\left(\mathrm{ft}^{3} / \mathrm{min}\right)$
$D L_{\text {post }}=$ Post-improvement duct leakage at $25 \mathrm{~Pa}(\mathrm{ft} 3 / \mathrm{min})$

[^6]$60=$ Constant to convert from minutes to hours
$H D D=$ Heating degree days
$24=$ Constant to convert from days to hours
$0.018=$ Volumetric heat capacity of air $\left(\mathrm{Btu} / \mathrm{ft}^{3} \mathrm{~F}\right)$
$1,000=$ Constant to convert from W to kW
HSPF = Heating Seasonal Performance Factor of existing system (Btu/W•hr)
Default value for HSPF $=7.30 .{ }^{10}$

### 6.1.1.3 Heating Savings (Electric Resistance):

$$
k W h_{\text {savings }, H}=\frac{\left(D L_{\text {pre }}-D L_{\text {post }}\right) \times 60 \times H D D \times 24 \times 0.018}{3,412}
$$

Where:

$$
\begin{aligned}
& D L_{\text {pre }}=\text { Pre-improvement duct leakage at } 25 \mathrm{~Pa}\left(\mathrm{ft}^{3} / \mathrm{min}\right) \\
& D L_{\text {post }}=\text { Post-improvement duct leakage at } 25 \mathrm{~Pa}\left(\mathrm{ft}^{3} / \mathrm{min}\right) \\
& 60=\text { Constant to convert from minutes to hours } \\
& H D D=\text { Heating degree days } \\
& 24=\text { Constant to convert from days to hours } \\
& 0.018=\text { Volumetric heat capacity of air }\left(\mathrm{Btu} / \mathrm{ft} 3^{\circ} \mathrm{F}\right) \\
& 3,412=\text { Constant to convert from Btu to } \mathrm{kWh}
\end{aligned}
$$

### 6.1.1.4 Demand Savings (Cooling):

$$
k W_{\text {savings }, C}=\frac{k W h_{\text {savings }, C}}{E F L H_{C}} \times C F
$$

Where:
$k W^{2} s a v i n g s_{c}=$ Calculated kWh savings for cooling
$E F L H_{\text {cooling }}=$ Equivalent full load cooling hours
$C F=$ Coincidence factor $=0.87^{11}$

[^7]Table 6-1 Input Values for Duct Sealing Calculations

| Parameter | Value | Source |
| :---: | :---: | :---: |
| DLpre | 335.1 | Calculated from tracking data |
| DLpost | 150.6 | Calculated from tracking data |
| Average reduction | 54.0\% | Calculated from tracking data |
| EFLH cooling | 2,092 | ENERGY STAR ${ }^{\circledR}$ Central AC Calculator |
| HDD | 1,093 | PG\&E workpaper ${ }^{12}$ |
| $h_{\text {out }}$ | 35.5 | Custom Calculation |
| $\mathrm{h}_{\text {in }}$ | 26.6 | Custom Calculation |
| SEER (average) | 12.48 | Calculated from tracking data |

All system types are subject to cooling savings however, additional savings from duct sealing is realized by heat pumps operating in heating mode as well as forced air electric resistance heaters. Heat pump units were directly observable in tracking data. For the remainder, ADM used the California Residential Appliance Saturation Survey (RASS) to estimate the percentage to homes with electric resistance heating. The additional weighted savings was then added to the base cooling savings.

### 6.1.2 Refrigerant Charge Adjustment Savings Calculations

A sample of 2,715 single family homes was used to develop average test-in and test-out data, as well as average tonnage and other parameters.
Deemed savings was calculated using test-in and test-out efficiency data:

$$
\left.\left.\begin{array}{c}
k W h_{\text {Savings_Cooling }}=C A P_{c} \times 1,000 \mathrm{~W} / k W \\
k W h_{\text {savings,HP }}=C A P \times \frac{1}{1,000 \mathrm{~W}} \times\left[\left(\frac{1}{E E R_{\text {pre }}}-\frac{1}{E E R_{\text {post }}}\right) \times E F L H_{C}\right. \\
H S P F_{\text {pre }}
\end{array}\right)-\left(\frac{E F L H_{C}}{E E R_{\text {post }}}+\frac{E F L H_{H}}{H S P F_{\text {post }}}\right)\right] .
$$

## 12

https://www.pge.com/includes/docs/pdfs/about/edusafety/training/pec/toolbox/arch/climate/california_climate_zone _15.pdf Average of Brawley and El Centro.

Where,
$C A P_{c}=$ Cooling capacity (in Btu)
$E E R_{\text {pre }}=$ Efficiency of the equipment prior to tune-up
$E E R_{\text {post }}=$ Nameplate efficiency of the existing equipment
$E F L H c=$ Equivalent Full-Load Cooling Hours
$\% C F=$ Peak Coincidence Factor

Table 6-2 Input Values for RCA Calculations

| Parameter | Value | Source |
| :---: | :---: | :---: |
| CAP (average) | $45,452 \mathrm{Btu}(3.788$ <br> TONS) | Calculated from <br> tracking data |
| EER $_{\text {pre }}$ (average) | 9.09 | Calculated based on <br> specific maintenance |
| EER $_{\text {post }}$ <br> (average) | 10.02 | Calculated from <br> tracking data |
| EFLH cooling | 2,092 | ENERGY STAR ${ }^{\oplus}$ Central <br> AC Calculator |

All system types are subject to cooling savings however, additional savings from RCAs are realized by heat pumps operating in heating mode as well as forced air electric resistance heaters. Heat pump units were directly observable in tracking data. The additional weighted savings was then added to the base cooling savings.

### 6.2 Duct Sealing and Refrigerant Charge Adjust Savings Results

Using the methods and parameters listed above, ADM calculated the average savings results presented below.

### 6.2.1 Duct Sealing

Table 6-3 Duct Sealing Savings

| System Type | kWh Savings |
| :--- | :---: |
| Cooling Savings (all systems) | $1,117.7$ |
| Heat Pump Savings (heating mode) | 686.5 |
| Forced Air Electric Resistance Heating | $1,468.7$ |
| Average per Home (based on equipment saturation) | $\mathbf{1 , 2 7 6 . 0}$ |

The average savings single family household in climate zone 15 is $1,276.0 \mathrm{kWh}$ and .465 kW . The 2016 CMUA TRM provides savings estimates of 488 kWh and .463 kW for duct sealing in CZ15. These savings are premised on a $20 \%$ reduction in leakage, however observed leakage reduction in the sampled homes is $44.6 \%$, resulting in higher kWh savings. Further, the CA TRM provides estimates for homes with electric cooling and gas heating only. Heat pump savings estimates are not available. This analysis includes heat pump cooling and heating mode savings, as well as homes for forced air electric resistance heating. Finally, TRM calculations are based on weather in the Blythe
area, which has lower cooling degree days than the regions in which duct sealing projects took place.

### 6.2.2 Refrigerant Change Adjustments

The E3 Tool used by IID reports savings and cost units per TONs cooling as opposed to per system or household. Savings results are present using the same convention.

Table 6-4 Refrigerant Charge Adjust Savings

| System Type | kWh Savings |
| :--- | :---: |
| Cooling Savings (all systems) | 255.0 |
| Heat Pump Savings (heating mode) | 113.6 |
| Average per TON (based on equipment saturation) | $\mathbf{2 8 5 . 3}$ |

The average savings single family household in climate zone 15 is 285.3 kWh and .106 kW per TON. The 2016 CMUA TRM provides savings estimates of 209.72 kWh and .181 kW for cooling system RCAs in CZ15. These savings are based on weather in the Blythe area, which has lower cooling degree days than the regions in which RCA projects took place.

### 6.1 Overall Savings Results

Verified savings for all measures in both program years are summarized in Table 6-5 through Table 6-9 below.

Table 6-5 Residential Realization Summary 2014

| Measure | Annual Energy Savings (kWh) |  | kWh <br> Realization Rate | Peak kW |  | kW <br> Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| Duct Sealing (Single Family Home) | 1,309,624 | 1,296,416 | 99.0\% | 1,247.65 | 472.44 | 37.9\% |

|  | Expected | Verified |  | Expected | Verified |  |
| Residential | 3,387,500 | 3,265,130 | 96.4\% | 2,277.69 | 2,538.12 | 111.4\% |
| Commercial | 425,268 | 425,268 | 100.0\% | 99.25 | 99.25 | 100.0\% |
| Total | 3,812,768 | 3,690,398 | 96.8\% | 2,376.94 | 2,637.38 | 111.0\% |

With the exceptions of single family home duct sealing and refrigerant charge adjustment measures, all ex ante savings values were found to be reasonable, thus no adjustments were made. For duct sealing and refrigerant charge adjustments measures, the Evaluators based ex post savings on estimates developed during their analysis of these measures. Since these measures were developed using data from the IID programs and inputs specific to the IID territory, they more accurately represent savings for these measures than those found in the TRM, whose estimates based on data averages from a variety of sources, and the more general CEC Climate Zone 15. The Evaluators recommend that future program year use these numbers as ex ante savings estimates developed for this report.

### 6.2 Process Evaluation Findings

- Consistent Program Design and Participation: Staff reported that during the 2014 and 2015 program years the design and delivery of the AC Maintenance Program remined unchanged. Enalasys continued as the program implementation contractor,
responsible for all program administration activities from scheduling and conducting audits, to performing QA/QC visits, to managing the list of approved contractors. Staff noted that the 2014 program year launched in February, while the 2015 program year launched in April. Both years were either fully, or near-fully, subscribed.
- High Demand for Program Offerings: Interviewed staff indicated that demand for this program remains high due the climate zone, which can result in up to nine or ten months consistent heat load. Also, many of the customers are income qualified, therefore offering these services at no-cost is a significant benefit to many residents in the service territory.
- Limited Contractor Enrollment: While the program is meeting its energy savings goal with the current pool of approved contractors, staff indicated they would like to enroll additional contractors in the Quality AC Maintenance Program. Diversifying the contractor pool will ensure the program is not adversely impacted by undesirable actions of a few contractors responsible for majority of program activity. Staff noted that enrolling new contractors has been challenging for several reasons.

Staff noted that contractors are reluctant to participate due to the technology requirements and the fact that the influx of tune-ups during spring and summer creates surges in their businesses that can be difficult to manage. According to interviewed staff, contractors would prefer to perform tune ups during their slow times in the Fall and Winter, not in the late Spring and Summer when they are experiencing high demand for their primary product and service offerings.

- Extended Contract Implementation Contract: Prior to 2015 the program implementation contractor, Enalasys, operated under a contract that required annual renewal. According to program staff, in 2015 IID and Enalasys executed a 3-year contract. The objective of the 3-year contract was to mitigate issues associated with the lead time required for program launch and improve overall program continuity.
- Contractor Issues Resolved: In 2015 the program identified a contractor that was manipulating the program and requesting rebates for projects where work was not completed. According to staff, Enalasys reimbursed IID the funds and worked to resolve the issue. The jobs were re-assigned to other contractors and the majority of the homes ultimately received the AC tune up; staff noted that some customers refused the work. IID staff were satisfied with way in which Enalasys resolved the contractor issue and since that time there have been no other incidents of wide-spread program manipulation.
- Effective Utility-Implementer Communication: Overall, IID staff reported that Enalasys has been able to meet IID's needs and that program operation and management had gone smoothly given budget supplementation. It is noted that this program flexibility may not always be possible due to the potential for future budgetary constraints often facing publicly owned utilities

### 6.3 Recommendations

- Update Duct Sealing and Refrigerant Charge Adjust Estimation Values. Savings estimation values in the CA TRM are developed to serve multiple utilities and
represent average values for an area larger than the IID service territory. For this report, estimated savings values for these measures were developed by the Evaluators using IID program-specific data and weather-sensitive inputs specific to the IID service territory ${ }^{13}$ where the majority of these projects occurred. Due to this specificity, the Evaluators recommend that future program year use the values as ex ante savings estimates developed for this report, specifically: 1,276 kWh and 0.465 kW per home for single family duct sealing and 285.3 kWh and 0.106 kW per ton cooling for single family refrigerant charge adjustments.

[^8]
## 7. Custom Energy Solutions Program

### 7.1 Program Description

The Custom Energy Solutions Program (CESP) seeks to provide financial incentives to IID's non-residential customers for energy efficient equipment and process improvements that reduce the customers energy consumption and demand. IID offers technical assistance to qualifying non-residential customers for purposes of identifying energy inefficiencies through a preliminary energy analysis (PEA). Eligibility for the PEA is based on IID's application review and may result in a pre-inspection site visit to identify baseline conditions and potential energy savings.

Qualifying energy efficiency measures (EEMs) must retrofit old equipment with new energy efficient technologies that exceed the applicable Title 24 requirements established by the California Energy Commission or current industry standards using IID-approved baselines. ${ }^{14}$ Incentives are capped at $\$ 150,000$ per account (or project site) and cannot exceed 50 percent of the installed cost for selected measures.

IID contracts with Optimize Energy for program implementation services.
Figure 7-1 Savings Contribution by Measure Type

[^9]
### 7.2 M\&V Methodology

CESP and NCEEP projects were combined into a single population from which a random sample was drawn. Sampling is detailed in section 2.2.2. of this report. Sampled sites were visit for verification and to collect information about the projects. Photo loggers were left at five sites to record lighting operation of areas with irregular hours. After the site visit a custom analysis was performed to develop realized savings estimates. A total of 19 sites from the 2014 and 2015 CESP programs were sampled.

Table 7-1 CESP Participation Summary

| Year | Count of <br> Sampled <br> Projects | Total <br> Projects | Sampled <br> $\boldsymbol{k W h}$ | Total <br> $\boldsymbol{k W h}$ |
| :--- | :---: | :---: | :---: | :---: |
| 2014 | 5 | 38 | 638,344 | $2,062,098$ |
| 2015 | 14 | 63 | $2,755,029$ | $6,206,617$ |
| Total | 19 | 101 | $3,393,373$ | $8,268,715$ |

### 7.3 Impact Findings

Energy savings was estimated using proven techniques, including engineering calculations using industry standards to determine energy savings. Sampled sites' realization rates varied between $53.9 \%$ and $171.1 \%$. Below, Table $7-2$ shows expected and realized saving for each sampled site. Detailed reports for each site can be found in Appendix: Site Reports.

Table 7-2 CESP Site-Level Realization Rates

| Project <br> Number | Program | Measure Type | Facility Type | Expected <br> kWh <br> Savings | Realized <br> kWh <br> Savings | Realization <br> Rate |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Project 1 | CESP 2015 | Lighting | Outdoor park | 2,642 | 4,529 | $171.4 \%$ |

7.3.1.1 CESP and NCEEP Programs Site-level Realization

Sites chosen within each stratum are visited to verify installation of rebated measures and to collect data needed for calculation of realized savings. The realization rates for sites within each stratum are then applied to the non-sampled sites within their respective stratum.

Table 7-3 shows the expected and realized energy savings for the programs by stratum.
Table 7-3 Expected and Verified Savings by Stratum

| Stratum | $\#$ <br> Sites | Expected <br> $\boldsymbol{k W h}$ <br> Savings | Realized <br> $\boldsymbol{k W h}$ <br> Savings | $\boldsymbol{k W h}$ <br> Realization <br> Rate | Expected <br> $\boldsymbol{k} W$ <br> Savings | Realized <br> $\boldsymbol{k} W$ <br> Savings | $\boldsymbol{k W}$ <br> Realization <br> Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 59 | 752,939 | 763,022 | $101.3 \%$ | 203.99 | 201.89 | $99.0 \%$ |
| 2 | 22 | $1,514,601$ | $1,929,313$ | $127.4 \%$ | 398.35 | 451.32 | $113.3 \%$ |
| 3 | 21 | $3,315,402$ | $2,649,097$ | $79.9 \%$ | 873.71 | 230.79 | $26.4 \%$ |
| 4 | 7 | $2,695,903$ | $2,525,896$ | $93.7 \%$ | 762.11 | 349.22 | $45.8 \%$ |
| 5 | 3 | $2,592,141$ | $3,446,671$ | $133.0 \%$ | 367.92 | 565.75 | $153.8 \%$ |
| Total | $\mathbf{1 1 2}$ | $\mathbf{1 0 , 8 7 0 , 9 8 7}$ | $\mathbf{1 1 , 3 1 3 , 9 9 8}$ | $\mathbf{1 0 4 . 1 \%}$ | $\mathbf{2 , 6 0 6 . 0 8}$ | $\mathbf{1 , 7 9 8 . 9 5}$ | $\mathbf{6 9 . 0 \%}$ |

Impact findings are discussed in detail in Sections 7. Custom Energy Solutions Program and 8. New Construction Energy Efficiency Program.

Below, Table 7-4 shows overall expected and realized saving for both program years:
Table 7-4 CESP Total Expected and Realized Savings by Year

| Year | Annual Energy Savings <br> (kWh) |  | kWh <br> Realization <br> Rate | Peak kW |  | kW <br>  <br> Realization <br> Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Verified |  |  |
| 2014 | $2,062,098$ | $2,146,132$ | $104.1 \%$ | 468.73 | 323.56 | $69.0 \%$ |
| 2015 | $6,206,617$ | $6,459,548$ | $104.1 \%$ | 1703.57 | 1175.96 | $69.0 \%$ |
| Total | $\mathbf{8 , 2 6 8 , 7 1 5}$ | $\mathbf{8 , 6 0 5 , 6 8 0}$ | $\mathbf{1 0 4 . 1 \%}$ | $\mathbf{2 , 1 7 2 . 2 9}$ | $\mathbf{1 , 4 9 9 . 5 1}$ | $\mathbf{6 9 . 0 \%}$ |

### 7.3.1.2 CESP - Causes of Savings Deviations

Overall program-level kWh realization was high (104.1\%). The peak kW realization rate is $69.0 \%$. Some projects demonstrated savings less than $100 \% \mathrm{kWh}$ savings. The Evaluators have summarized these projects in Table 7-5 for illustrative purposes.

Table 7-5 CESP - Causes of Low Realization

| Project ID | $\begin{array}{c}\text { Expected } \\ \text { kWh }\end{array}$ | Verified kWh | $\begin{array}{c}\text { Realization } \\ \text { Rate }\end{array}$ | Causes of Low Realization |
| :---: | :---: | :---: | :---: | :--- |$]$| Project 2 |
| :--- |
| Project 5 |
|  |

|  |  |  |  | them. |
| :---: | :---: | :---: | :---: | :---: |
| Project 13 | 178,700 | 135,503 | 75.8\% | This project is process improvements at a manufacturing facility. Ex ante calculations only used four months of the utility data to estimate the baseline energy usage. instead of using all the available utility data without providing a reason for the exclusion. The utility data does not show large changes over time that could be related to increase in production rates. The four months included in the baseline contain two of the highest billed months which will overestimate the pre-installation annual energy consumption. |
| Project 14 | 346,847 | 270,915 | 78.1\% | This project is a lighting retrofit and HVAC unit replacements at a middle school. Ex ante calculations assumed classroom lighting operated 1,800 hours annually, and occupancy sensors would decrease this by $28 \%$ to 1,296 . The 2014 CA TRM recommends an $18 \%$ reduction for classrooms for wall or ceiling-mounted occupancy sensors, so the Evaluators revised the reduction in hours to $18 \%$. This resulted in 1,455 post-sensor retrofit AOH for several classrooms, slightly lowering lighting kWh realization. Additionally, all exterior retrofits assumed $4,380 \mathrm{AOH}$, however this was adjusted to 4,313 to match the IID territory NDH, further reducing the realized kWh. Calculations for 24 previously-installed 18W CFLs assumed 20W per lamp, which was corrected to 18 W in ex post calculations. <br> The EFLHc value used in ex ante savings calculations is 2,883 , which would reflect continuous operation of all units for approximately 13.8 hours per day for all school days during the school year. This EFLHc was adjusted to 1,267 based on the cooling EFLHc from the New Mexico TRM for a primary school in Las Cruces, NM, which is in the same ASHRAE climate zone as this school. |
| Project 16 | 406,538 | 383,803 | 94.4\% | This project is a lighting retrofit at a department store. Ex ante calculations were premised on higher annual lighting operation hours $(5,500)$ than those recorded by photo logging equipment left on site ( 5,078 for the sales floor and 5,241 for the back offices). |
| Project 17 | 607,198 | 531,826 | 87.6\% | This project is a lighting retrofit and HVAC unit replacements at a high school. Ex ante calculations assumed classroom lighting operated 1,800 hours annually and occupancy sensors would decrease this by $28 \%$ to 1,296 . The 2014 CA TRM recommends an $18 \%$ reduction for classrooms for wall or ceiling-mounted occupancy sensors, so the Evaluators revised the reduction in hours to $18 \%$. This resulted in 1,455 post-sensor retrofit AOH for |

|  |  |  |  | the majority of the classrooms, slightly lowering lighting kWh realization. Offices and administrative areas were also assumed to have a $28 \%$ reduction in operating hours due to occupancy sensors, but this was changed to $22 \%$ for the same reasons classroom hours were changed. These both contributed to lower lighting kWh realization. Additionally, all exterior retrofits assumed 4,380 AOH , however this was adjusted to 4,313 to match the IID territory NDH, further reducing the realized kWh. Calculations for 88 previously-installed 18 W CFLs assumed 20W per lamp, which was corrected to 18 W in ex post calculations. <br> Ex ante HVAC calculations specified a 11.1 EER value for newly-installed equipment. The Evaluators verified nameplate information gathered during the on-site visits and found the EER values of the new equipment to be 12.0 according to the manufacture's specifications. Additionally, the EFLHc value used in ex ante savings calculations is 2,883 , which would reflect continuous operation of all units for approximately 13.8 hours per day for all school days during the school year. This EFLHc was adjusted to 1,267 based on the cooling EFLHc from the New Mexico TRM for a primary school in Las Cruces, NM, which is in the same ASHRAE climate zone as this school |
| :---: | :---: | :---: | :---: | :---: |

Key issues identified in site-level analyses include:

- Calculations do not include HVAC interactive effects. Lighting in air conditioned and refrigerated spaces adds heat to the space, increasing the cooling requirement during the cooling season and decreasing the heating requirement during the heating season. The decrease in waste heat from lighting mitigates these effects, thus reducing electricity used for cooling and increasing electricity or gas used for heating.
- All calculations assumed a 100\% peak coincidence factor. All kW savings estimates were produced assuming all fixtures would be in operation during peak periods. IID does not specify a peak period, however system loads tend to be the highest during summer afternoon and evenings. It is unlikely that lighting will be operating during this time for many space type, such as dusk-to-dawn lighting, The Evaluators used deemed peak coincidence factors taken from the 2014 CA TRM to estimate the likelihood of connected load during these times. This was the primary driver of the low kW realization.
- Non-daylight hours are overestimated. Calculations for lamps controlled by photocells of otherwise operating during non-daylight hours all assumed 4,380 annual operating hours, which is continuous operation divided by two. The Evaluators used sunrise/sunset times from the US Naval Observatory to develop latitude-specific non-daylight hours for the IID territory, result in 4,313 annual
operating hours. This slightly decreased savings for fixtures operating on this schedule.

### 7.4 Process Evaluation Findings

- Reduced Program Budgeting: Staff reported that during the 2014 program year, the program utilized approximately half of the budget. Staff reported that the budget for the CESP was reduced during the 2015 program cycle. The budget reduction was in response to the effective date ${ }^{15}$ of the California Energy Commission Title 24. Title 24 increased the baseline requirements for residential and non-residential buildings, which increased the barriers to program participation as customers were, by code, required install more efficient equipment types.
- Program Activity Trends: The largest portion of program savings in 2014 and 2015, similar to the previous evaluation period, was from lighting retrofits. HVAC and refrigeration projects also produced significant savings, however lighting is responsible for the "lion's share" of program activity. Staff noted that as the building codes continue to evolve, and baseline efficiency standards increase, the program will have to strategize about ways to encourage deeper, non-lighting energy savings.
- Detailed Application Review: As in previous program years, if IID determines that an existing application does not contain sufficient information or that the listed project does not qualify for an incentive, program staff will work with the customer by providing recommendations and commentary about why the application cannot be accepted. This provides the customer with an opportunity to revise the project or provide additional information as needed. Additionally, providing feedback to customers helps to maintain customer satisfaction levels, even if those customers' incentive applications are ultimately denied.
- Sufficient Quality Assurance Procedures: Staff reported that IID's quality control efforts are approximately $95 \%$ successful, with a $5 \%$ margin of error. Typically, the primary discrepancy is related to installed quantities. Staff reported that if a discrepancy exists they will contact the customer to resolve the issue, if the measure counts are not reconciled the customer will be notified of the adjust rebate amount based on actual installed quantities. Staff noted that all projects over $\$ 2500$ receive a pre-inspection; this incentive threshold is an internal benchmark, set by staff, and is not predefined in the program guidelines. The object is to have a systematic approach to vet larger projects to ensure expected energy savings are achieved.

### 7.5 Recommendations

- Include HVAC interactive effects in lighting impact savings calculations. Efficient lighting wastes less heat and reduces load on HVAC systems, which are more heavily taxed in climate zone 15 than others. Omitting these interactive effects in savings calculations underestimates savings.

[^10]- Include CA TRM deemed peak coincidence factors in lighting impact savings calculations. Not all fixture operate during times of peak system load. Assuming they do can dramatically overestimate peak kW reductions. Different space types have different likelihoods of peak kW reduction, thus it is recommended that a peak coincidence factor be included in savings calculations to accurately calculate peak kW reductions. The CA TRM provides a suitable list of coincidence by space type.
- Consider creating a prescriptive lighting calculator and making it available for trade allies. These tools typically include lookups for fixture wattages including ballast factors, deemed hours by space type, interactive and coincidence factors. This tool can simplify the application and approval processes, as well reduce errors and provide more accurate savings in aggregate.
- Consider a Relational Database for Program Tracking: The current method for tracking program activity is Excel spreadsheets. Program staff indicated that the spreadsheets are sufficient for tracking program activity including customer information and project parameters, however it can become more difficult to extract custom reports and identifying projects status. A relational database, integrated with SAP, would created efficiencies for staff responsible for checking application/project status, performing data entry, running customer reports.
- Invest in Program Marketing and Outreach: During the 2014 and 2015 program years, marketing efforts were scaled back and according to program staff activity slowed. IID should strategize about low-cost ways to ensure residential and nonresidential customers are aware of program offerings. Such strategies could include bill inserts or promotional mailers.
- Ensure Consistency Among Program Documents: Although the CESP Rebate Agreement indicates that measure savings must persist for five years, the Program Guidelines document states that "...you agree to continue using the installed EEMs for at least one year from the commission date." ${ }^{16}$ In order to avoid customer confusion regarding this rule, IID should ensure that all CESP documentation specifies the five years, rather than one year, requirement.
- Replace CFL Measures with LEDs: LEDs provide greater kWh and kW savings and EULs than CFLs while maintaining the same lumen outputs. LED lighting costs have declined as the market matured and with the relaxation of the longevity standards under ENERGY STAR 2.0 guidelines. Additionally, ENERGY STAR certified lighting has largely transitioned from CFLs to LEDs ${ }^{17}$.
- Re-evaluate Program Budget Allocation: Given the cost effectiveness and significant potential for energy savings, budget allocation for this program should be re-evaluated and adjusted upwards, particularly in light of regulatory requirements related to Senate Bill 350 (2017) that mandates doubling of energy efficiency goals by 2030.

[^11]
## 8. New Construction Energy Efficiency Program

### 8.1 Program Description

The New Construction Energy Efficiency Program (NCEEP) seeks to provide incentives for new construction or remodel projects that achieve at least 10\% energy savings over Title 24 requirements. The program offers two tracks for qualifying participants: Whole Building approach, and the Systems approach. The Whole Building approach involves indepth energy analysis and design assistance that seeks to optimize building energy efficiency and achieve substantial cost savings from multiple building systems.
In contrast, the Systems approach is a simplified method that allows participants to focus on individual building components. Under the Whole Building approach, the program would seek to achieve the $10 \%$ target throughout the building, while the Systems approach would focus on achieving at least $10 \%$ above Title 24 requirements for particular equipment systems.

Figure 8-1 Savings Contribution by Measure Type

### 8.2 M\&V Methodology

The M\&V methodology for NCEEP program is the same as the CESP program and is described section 2.2.2. of this report. Two sites from the 2015 NCEEP program, a fast food restaurant which performed building envelope improvements above code, and an indoor sports complex which upgrades insulation and retrofitted lighting were selected in the random sample for on site inspection and custom analysis.

Table 8-1 NCEEP Participation Summary

| Year | Count of <br> Sampled <br> Projects | Total <br> Projects | Sampled <br> $\boldsymbol{k W h}$ | Total <br> $\boldsymbol{k W h}$ |
| :--- | :---: | :---: | :---: | :---: |
| 2014 | 1 | 6 | 798,783 | $1,375,372$ |
| 2015 | 1 | 5 | 28,816 | $1,226,900$ |
| Total | 2 | 11 | 827,599 | $\mathbf{2 , 6 0 2 , 2 7 2}$ |

### 8.3 Impact Findings

Energy savings was estimated using proven techniques, including engineering calculations using industry standards to determine energy savings. The sampled site realization is $126.7 \%$, and the over NCEEP programs realization rates extrapolated from the sample are $104.1 \%$ for $\mathrm{kWh}, 69.0 \%$ for kW. Below, Table 8 - 2 shows overall expected and realized saving for both program years:

Table 8-2 NCEEP Total Expected and Realized Savings by Year

| Year | Annual Energy Savings (kWh) |  | kWh Realization Rate | Peak kW |  | kW <br> Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Expected | Verified |  | Expected | Verified |  |
| 2014 | 1,375,372 | 1,431,420 | 104.1\% | 292.04 | 201.60 | 69.0\% |
| 2015 | 1,226,900 | 1,276,898 | 104.1\% | 141.75 | 97.85 | 69.0\% |
| Total | 2,602,272 | 2,708,319 | 104.1\% | 433.79 | 299.44 | 69.0\% |

### 8.4 Process Evaluation Findings

- Consistent Program Design and Participation: Staff reported that during the 2014 and 2015 program years the design and delivery of the NCEEP program remained unchanged. The number of projects completed during the 2014 and 2015 program years was between 3-5 projects, which was similar to the previous evaluation period (2012-2013). Staff indicated that the current level of program activity for the NCEEP is in accordance planning assumptions. Very little outreach is done to ensure this program stays within budget.
- Detailed Application Review: Once an application is submitted, IID, with the technical support of Optimized Energy, reviews the design plans and energy savings calculations including assumptions and models. The level of assistance provided by the program varies based on the specific project and whether the applicant decides to pursue the Whole Building approach or the Systems approach. IID may recommend energy savings equipment or strategies to enhance the buildings/systems design and achieve deeper energy savings.
- Potential Effectiveness of Design Phase Recruitment: During program years 2014 and 2015, as with previous program years, the program requires customers to apply within the same calendar year of the commissioning date, ${ }^{18}$ but there is no specific requirement that the project must still be early in the design phase to be eligible for incentives. Staff noted that approximately 90\% of projects are submitted after design is complete.
- New Service Requests Utilized as an Outreach Channel: Interviewed staff noted that when a non-residential customer makes a new service request, the IID customer operations section will notify the NCEEP program specialist. The program specialist will then reach out to the customer regarding program offerings and determine if there is interest in design assistance and/or new construction incentives.

### 8.5 Recommendations

- Include HVAC interactive effects and peak CFs per space type for lighting calculations. See section 7.5, CESP Recommendations, for details.
- Consider Strategies to Engage New Construction Participants Early in the Design Phase: From our experience evaluating new construction programs in various regions around the country, early project involvement is a key program design element incorporated into many successful new construction programs. Early involvement allows for program staff, or its implementation contractor, to be integrated into the design process when decisions regarding building energy efficiency are made.

Other process-related recommendations from the CESP section (section 7.5) also apply to NCEEP.

[^12]
## 9. Appendix: Site Reports

Project Number Project 1
Program CESP 2015

## Project Background

The participant is a park that received incentives from IID for retrofitting existing exterior lighting with energy efficient lighting. Evaluators verified the installation and operation of the following measures:

- (14) 19 W LEDs, replacing (5) 150W high pressure sodium fixtures.

Lighting operation schedules were also collected through staff interviews to determine AOH .

## Calculation Parameters

Savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{E}$ | IEF $_{\boldsymbol{D}}$ | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Exterior | No | 4,313 | 1.00 | 1.00 | $0 \%$ |

## Savings Calculations

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| HPS150 to LED19W | 5 | 14 | 188 | 19 | 0.00 | 0.66 | 0.00 | 1.00 | 0.0\% |
|  |  |  |  |  | Total | 0.66 | 0.00 |  | 0.0\% |

## Results

The kWh and kW realization rates for Project 1 are $171.4 \%$ and $0.0 \%$, respectively.
Ex ante calculations assumed annual lighting hours of operation of 4,105, however the lights are on photosensors, so ex ante calculations use non-daylight hours appropriate for the IID territory $(4,313)$, raising the realization rate. Also, ex ante calculations assumed newly-installed energy efficient fixture wattage was 28 W per lamp, however during the on-site inspection it was discovered that the new lighting was only 19 watts per lamp. The Evaluators also adjust pre-retrofit wattages of the high pressure sodium fixtures from 150w to 188w to account for the ballast factor. Both of these adjustments increased the kWh realization rate. Finally, these lamps only operate during non-daylight hours, thus provide no peak kW reduction.

Table D, Verified Gross Savings \& Realization Rates

| Measure | Verified |  |  |  |

|  | kWh Savings | kW Savings | kWh <br> Realization <br> Rate | kW <br> Realization <br> Rate |
| HPS150 to LED19W | 4,529 | 0.00 | $171.4 \%$ | $0.0 \%$ |
| Total | $\mathbf{4 , 5 2 9}$ | $\mathbf{0 . 0 0}$ | $\mathbf{1 7 1 . 4 \%}$ | $\mathbf{0 . 0 \%}$ |

## Project Background

The participant is a boutique clothing store that received incentives from IID for retrofitting existing lighting with energy efficient lighting. Evaluators verified the installation and operation of the following measures:

- (94) 9W LED lamps, replacing (94) 20W halogen lamps
- (30) 4W LED lamps, replacing (30) 35W halogen lamps

Lighting operation schedules were also collected through staff interviews to determine AOH .

## Calculation Parameters

Savings calculations were performed using the methods described in section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{E}$ | IEF $_{\boldsymbol{D}}$ | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Small Retail | Yes | 2,190 | 1.17 | 1.24 | $88 \%$ |

## Savings Calculations

Table B, Lighting Retrofit kWh Savings Calculations

| Measure | Quantity (Fixtures) |  | Wattage |  | AOH | Expected <br> kWh <br> Savings | Realized <br> kWh <br> Savings | $I E F_{E}$ | Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| H20/1 to 9W LED | 94 | 94 | 20 | 9 | 2,190 | 3,774 | 2,649 | 1.17 | 70.2\% |
| H35/1 to 4W LED | 30 | 30 | 35 | 4 | 2,190 | 3,395 | 2,383 | 1.17 | 70.2\% |
|  |  |  |  |  | Total | 7,169 | 5,032 |  | 70.2\% |

Table C, Lighting Retrofit kW Savings Calculations

| Measure | Quantity (Fixtures) |  | Wattage |  | CF | Expected <br> kW <br> Savings | Realized kW Savings | $I E F_{D}$ | Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| H20/1 to 9W LED | 94 | 94 | 20 | 9 | 0.88 | 1.03 | 1.13 | 1.24 | 109.7\% |
| H35/1 to 4W LED | 30 | 30 | 35 | 4 | 0.88 | 0.93 | 1.01 | 1.24 | 108.6\% |
|  |  |  |  |  | Total | 1.96 | 2.14 |  | 109.2\% |

## Results

The kWh realization rate for Project 2 is $70.2 \%$ and the kW realization rate is $109.2 \%$.
The kWh realization rate is low because annual lighting hours used in ex ante calculations $(3,650)$ were much lower than those verified on site and used in ex post calculations $(2,190)$. Also, ex ante calculations did not use energy or demand factors to account for the reduced load on the HVAC system because of the more efficient lighting. Accounting for these in ex post calculations increased both kWh and peak kW realized savings.

Table D, Verified Gross Savings \& Realization Rates

Project Number Project 5
Program CESP 2015

## Project Background

The participant is a convenience store that received incentives from IID for implementing a facility Energy Management System (EMS). On-site, the Evaluators verified the installation and operation of the following measures:

- EMS controls

## Calculation Parameters

Savings calculations were performed by analyzing the savings associated with this same measure on several similar systems. Savings at 179 other stores were analyzed using a billing analysis for 12 months before and after installation was completed. An average of all the facility savings is used for this store. Since this facility did not upgrade the lighting system as was done on the other sites, the potential energy savings for lighting was subtracted from the average savings.

Annual Energy Savings $=$ Average EMS savings - Lighting Savings
Lighting Savings $=$ Ext Light $x$ Runtime Reduction $x 365$
Where,
Average EMS SavingsWhole facility EMS savings based on past projects, kWh
Lighting SavingsEMS savings associated with the exterior lighting, kWh
Ext LightAverage exterior lighting wattage, kW
Runtime ReductionEMS reduced daily reduced runtime, hours/day
365Days per year, days/year

Savings parameters used are shown in Savings calculations were performed using the methods described in section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | EMS Savings | Lighting Savings | kWh Savings |
| :---: | :---: | :---: | :---: |
| Small Retail | 16,323 | 2,730 | 13,593 |

## Savings Calculations

Table B, HVAC kWh Savings Calculations

| Measure | Expected <br> $k W h$ Savings | Realized <br> $k W h$ Savings | Realization <br> Rate |
| :---: | :---: | :---: | :---: |
| EMS | 15,870 | 13,593 | $85.7 \%$ |
| Total | 15,870 | 13,593 | $\mathbf{8 5 . 7 \%}$ |

Table C, HVAC kW Savings Calculations

| Measure | Expected <br> $k W$ Savings | Realized kW <br> Savings | Realization <br> Rate |
| :---: | :---: | :---: | :---: |
| EMS | 1.81 | 1.55 | $85.7 \%$ |
| Total | 1.81 | 1.55 | $85.7 \%$ |

## Results

The kWh and kW realization rates for Project 5 are both 85.7\%.
Ex-ante calculations removed 16 stores that showed negative savings comparing the 12 months before and after the EMS was installed. The reason for removal was unclear. The Evaluators included data from all sites in their calculations, resulting in a lower realized savings.

## Project Background

The participant is a new construction fast food restaurant that received incentives from IID for implementing energy efficient improvements above code minimum. On-site, the Evaluators verified the installation and operation of the following measures:

- Four (4) packaged rooftop air conditioning units
- Double pane windows
- LED lighting

## Calculation Parameters

Savings calculations were performed using an energy model compared to title 24 minimum building code. The evaluator checked the provided energy model for consistency with the site visit and building plans as well as doing ballpark savings estimates to validate the claimed savings.

Annual Energy Savings = Baseline Energy Usage - Proposed Energy Usage Where, Baseline Energy UsageBaseline Title 24 energy usage, kWh/yr Proposed Energy UsgeProposed energy usage, kWh/yr

## Savings Calculations

Table A, HVAC kWh Savings Calculations

| MH250 to LED78W | 12 | 12 | 291 | 78 | 1.00 | 2.56 | 2.99 | 1.17 | 116.8\% |
|  |  |  |  |  | Total | 6.23 | 7.29 |  | 117.0\% |

## Results

The kWh and kW realization rates for project Project 7 are $165.9 \%$ and $117.0 \%$, respectively.

Ex ante calculation assumed that 12 fixtures operated 4,380 hours annually, however on site the Evaluators determined all fixtures operated continuously $(8,760)$, resulting in high kWh savings for those lamps. Additionally, ex ante calculations did not account for the reduced load on the HVAC system as a result of the more efficient lighting. Accounting for this increased both kWh and peak kW savings.

| Total | $\mathbf{6 3 , 8 3 2}$ | $\mathbf{7 . 2 9}$ | $\mathbf{1 6 5 . 9 \%}$ | $\mathbf{1 1 7 . 0 \%}$ |

## Project Background

The participant is a grocery store that received incentives from IID for replacing shaded pole motors with electronically commutated motors (ECM) and installing night covers on open display cases. On-site, the Evaluators verified the installation and operation of the following measures:

- 26 ECMs in walk-in refrigerator
- 7 ECMs in walk-in freezers
- 107 ECMs in reach-in refrigerators
- 45 four foot vertical night covers
- 1 seven foot vertical night cover
- 4 six foot horizontal night covers

## Calculation Parameters

Savings calculations were performed by using prescriptive deemed savings from SCE and PG\&E workpaper studies.

$$
\begin{gathered}
\text { Annual Energy Savings }=\text { ECM Savings }+ \text { Night Cover Savings } \\
\text { ECM Savings }=\sum_{\text {ECM }} \# \text { of Motors } x \text { Savings per Motor } \\
\text { Night Cover Savings }=\sum_{\text {Cover }} \text { Linear Feet of Cover x Savings per Linear Foot }
\end{gathered}
$$

Parameters specific to this site are listed below in Table A:
Table A, Savings Parameters

| Measure Type | \# of Motors <br> or Linear Ft | kWh/motor or <br> $\boldsymbol{k W h} / L F$ | kWh Savings |

| Night Covers | 0 | 0 | - |
| Total | - | 9.91 | - |

## Results

The kWh realization rate for Project 8 is $103.87 \%$. While not claimed in ex ante calculations, the project resulted in 9.91 peak kW savings.

The realization rate is high because the ex post calculations used the savings values from the SCE and PG\&E workpapers as the deemed savings sources. A few minor quantity variations were found between the ex-ante calculations and the invoice provided but these had a very minor effect on the savings.

Table D, Verified Gross Savings \& Realization Rates

| Measure | Verified |  |  |  |
| ---: | :---: | :---: | :---: | :---: |
|  | kWh Savings | kW Savings | kWh <br> Realization <br> Rate | kW <br> Realization <br> Rate |
| ECM | 43,776 | 9.91 | $79.0 \%$ | - |
| Night Covers | 26,569 | - | $215.4 \%$ | - |
| Total | 70,345 | 9.91 | $103.9 \%$ | - |

## Project Background

The participant is a senior community that received incentives from IID for retrofitting existing lighting with energy efficient lighting. On-site, the Evaluators verified the installation and operation of the following measures:

- (200) 18w LED - non-int. ballasts replaced (200) 4' 1-lamp T8s;
- (42) 7w LED - non-int. ballasts replaced (42) 35w 1-lamp halogens;
- (125) 9 w LED - non-int. ballasts replaced (125) 2' 1-lamp T8s;
- (252) 16 w LED - non-int. ballasts replaced (252) 4' 1-lamp T8s;
- (246) 12w LED - non-int. ballasts replaced (246) 4' 1-lamp T8s;
- (76) 11w LED - non-int. ballasts replaced (76) 60w incandescent fixtures; and
- (142) 5 w LED - non-int. ballasts replaced (142) 25 w incandescent fixtures.

Lighting operation schedules were also collected through staff interviews to determine AOH .

## Calculation Parameters

Lighting savings calculations were performed using the methods described in section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | Air <br> Conditioning | Annual <br> Hours | IEF $_{\boldsymbol{E}}$ | IEF $_{\boldsymbol{D}}$ | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Small Office | Yes | 5,658 <br> 5,840 | 1.21 | 1.30 | $100 \%$ <br> 19 |
| Exterior | No | 4,380 | 1.00 | 1.00 | $0 \%$ |

## Results

The kWh and kW realization rates for Project 9 are 138.3\% and 107.6\%, respectively.

Ex ante calculations assumed all areas operated 4,745 hours annually. On site the Evaluators collected operating hours by area and adjusted savings calculations to reflect actual hours of operation: 5,658 and 5,840, depending upon specific area.

These changes raised kWh savings estimates. All exterior retrofits assumed 4,380 AOH , however these were also adjusted to 4,313 to match the IID territory NDH. Ex ante calculations did not use interactive energy or demand factors to account for the reduced load on the HVAC system because of the more efficient lighting. Accounting for these in ex post calculations increased both kWh and peak kW realized savings. Finally, all ex ante kW reduction calculations assumed a 100\% peak coincidence factor for exterior lighting. The Evaluators adjusted this factor to $0 \%$ to account for dusk-to-dawn operation reducing the kW realization rate.

## Project Background

The participant is an elementary school that received incentives for retrofitting interior and exterior lighting, installing occupancy sensors to control portions of the newly-installed lighting and retrofitting existing air conditioners and heat pumps with more efficient units. On-site, the Evaluators verified the installation and operation of the following measures:

- (584)4' 3-Lamp T8 28W RLOs r replaced (584) 3' 4-Lamp T8s
- (72)4' 2-Lamp T8 28W RLOs r replaced (72) 4' 2-Lamp T8s
- (18)29W LED - Non-Int. ballasts $r$ replaced (18) 70W metal halides
- (8)29W LED - Non-Int. ballasts r replaced (8) 3' 4-Lamp T8s

Additionally, occupancy sensors were installed to control 100 of the newly-installed fixtures. On site, lighting operation schedules were also collected through staff interviews and photo-logging equipment was placed on site to monitor lighting operation.

## Calculation Parameters

Lighting savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{E}$ | IEFD | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Primary School <br> (classrooms) | Yes | 1,800 | 1.21 | 1.30 | $20 \%$ |
| Primary School <br> (non- <br> classrooms) | Yes | Custom, <br> varies by <br> area | 1.21 | 1.30 | $20 \%$ |
| Exterior | No | 4,313 | 1.00 | 1.00 | $0 \%$ |

## Results

The kWh and kW realization rates for Project 10 are $105.3 \%$ and $1.0 \%$, respectively.
All exterior retrofits assumed $4,380 \mathrm{AOH}$, however this was adjusted to 4,313 to match the IID territory NDH, further reducing the realized kWh. Ex ante calculations did not use interactive energy or demand factors to account for the reduced load on the HVAC system because of the more efficient lighting. Accounting for these in ex post calculations increased both kWh and peak kW realized savings. Ex ante calculations assumed classroom lighting operated 1,800 hours annually, and occupancy sensors would decrease this by $28 \%$ to 1,296 . The 2014 CA TRM recommends an $18 \%$ reduction for classrooms for wall or ceiling-mounted occupancy sensors, so the Evaluators revised the reduction in hours to $18 \%$. This resulted in 1,455 post-sensor retrofit AOH for several classrooms, slightly lowering lighting kWh realization. Finally, all ex ante kW reduction calculations assumed a 100\% peak coincidence factor for interior and exterior lighting. The Evaluators adjusted this factor to $2 \%$ for interior lighting and $0 \%$ for exterior lighting, in accordance with deemed TRM specifications for secondary schools, causing the low lighting kW realization rate.

Program CESP 2015

## Project Background

The participant is a middle school that received incentives for retrofitting interior and exterior lighting, installing occupancy sensors to control portions of the newly-installed lighting and retrofitting existing air conditioners and heat pumps with more efficient units. On-site, the Evaluators verified the installation and operation of the following measures:

- (584)4' 3-Lamp T8 28W RLOs r replaced (584) 3' 4-Lamp T8s
- (72)4' 2-Lamp T8 28W RLOs r replaced (72) 4' 2-Lamp T8s
- (18)29W LED - Non-Int. ballasts $r$ replaced (18) 70 W metal halides
- (8)29W LED - Non-Int. ballasts r replaced (8) 3' 4-Lamp T8s

Additionally, occupancy sensors were installed to control 100 of the newly-installed fixtures. On site, lighting operation schedules were also collected through staff interviews and photo-logging equipment was placed on site to monitor lighting operation.

## Calculation Parameters

Lighting savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEFE $_{E}$ | IEFD | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Primary School <br> (classrooms) | Yes | 1,800 | 1.21 | 1.30 | $20 \%$ |
| Primary School <br> (non- <br> classrooms) | Yes | Custom, <br> varies by <br> area | 1.21 | 1.30 | $20 \%$ |
| Exterior | No | 4,313 | 1.00 | 1.00 | $0 \%$ |

## Savings Calculations

Table B, Lighting Retrofit kWh Savings Calculations

| Measure | Quantity (Fixtures) |  | Wattage |  | $\begin{gathered} A O H \\ \text { (no } \\ \text { sensors) } \end{gathered}$ | $\begin{aligned} & \text { AOH (w/ } \\ & \text { sensor } \\ & \text { reduction) } \end{aligned}$ | Expected <br> kWh <br> Savings | Realized <br> kWh <br> Savings | $I E F_{E}$ | Realization Rate |

## Results

The kWh and kW realization rates for Project 11 are $102.5 \%$ and $1.9 \%$, respectively.
Ex ante calculations assumed classroom lighting operated 1,800 hours annually, and occupancy sensors would decrease this by $28 \%$ to 1,296 . The 2014 CA TRM recommends an 18\% reduction for classrooms for wall or ceiling-mounted occupancy sensors, so the Evaluators revised the reduction in hours to 18\%. This resulted in 1,455 post-sensor retrofit AOH for several classrooms, slightly lowering lighting kWh realization. Additionally, all exterior retrofits assumed 4,380 AOH, however this was adjusted to 4,313 to match the IID territory NDH, further reducing the realized kWh. Ex ante calculations did not use interactive energy or demand factors to account for the reduced load on the HVAC system because of the more efficient lighting. Accounting for these in ex post calculations increased both kWh and peak kW realized savings. Finally, all ex ante kW reduction calculations assumed a 100\% peak coincidence factor for interior and exterior lighting. The Evaluators adjusted this factor to 2\% for interior lighting and 0\% for exterior lighting, in accordance with deemed TRM specifications for secondary schools, causing the low lighting kW realization rate.

Program CESP 2015

## Project Background

The participant is a car dealership that received incentives from IID for retrofitting existing exterior lighting with energy efficient lighting in their showroom and facility exterior. Onsite, the Evaluators verified the installation and operation of the following measures:

- (8) fluorescent fixtures were delamped
- (52) 77W LED fixtures replaced (51) 68W incandescent lamps
- (8) 196W LED fixtures replaced (8) 1000W metal halide fixtures
- (84) 276 W LED fixtures replaced (84) 1000W metal halide fixtures
- (6) 60W LED fixtures replaced (6) metal halide wall packs

Lighting operation schedules were also collected through staff interviews to determine AOH .

## Calculation Parameters

Savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{E}$ | IEF $_{\boldsymbol{D}}$ | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Small Retail | Yes | $4,563^{20}$ | 1.17 | 1.24 | $100 \%^{1}$ |
| Exterior | No | $1,092^{1}$ | 1.00 | 1.00 | $0 \%$ |

[^14]

|  |  |  |  |  | Total | 40.82 | 1.41 |  | 3.5\% |

## Results

The kWh realization rate for Project 12 is $53.9 \%$ and the kW realization rate is $3.5 \%$.
Ex ante calculations assumed annual lighting hours of operation of 4,368 for interior lighting and 2,184 for exterior lighting. The Evaluators developed lighting schedules based on interviews conducted with staff while on site. Verified operating schedules resulted in 4,563 AOH for interior fixtures and 1,095 AOH for exterior fixtures. This slightly increased interior realized kWh but decreased exterior realized kWh. Additionally, ex ante calculations assumed a peak coin factor of $100 \%$ for all areas, however the Evaluators determined that exterior fixtures only operate during non-peak hours, thus no peak kW savings can be attributed to them.

Table D, Verified Gross Savings \& Realization Rates

| Measure | Verified |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | kWh Savings | kW Savings | kWh <br> Realization <br> Rate | kW <br> Realization <br> Rate |
| LED upgrade | 8,755 | 2.03 | $122.2 \%$ | $123.8 \%$ |
| LED upgrade | $-2,680$ | -0.62 | $122.2 \%$ | $124.0 \%$ |
| LED upgrade | 5,663 | 0.00 | $101.5 \%$ | $0.0 \%$ |
| LED upgrade | 7,744 | 0.00 | $50.1 \%$ | $0.0 \%$ |
| LED upgrade | 73,952 | 0.00 | $50.0 \%$ | $0.0 \%$ |
| LED upgrade | 2,615 | 0.00 | $59.0 \%$ | $0.0 \%$ |
|  | 96,049 | 1.41 | $53.9 \%$ | $3.5 \%$ |
| Total |  |  |  |  |

## Project Background

The participant is a manufacturing facility that received incentives from IID for improving their process equipment energy efficiency with an increase in production. On-site, the Evaluators verified the installation and operation of the following measures:

- 250 ton all electric injection molder
- 110 ton all electric injection molder

## Calculation Parameters

Savings calculations were performed using utility data and savings methodology described below using site visit data. With the increased production the baseline energy usage needs to be normalized to the post production amount. The utility data did not show any correlation with outdoor weather data so this variable was not used in the calculations.

$$
\begin{gathered}
\text { Annual Energy Savings }=\left(\text { Adjusted } k W h_{\text {Pre }}-k W h_{\text {Post }}\right) \\
\qquad k W h_{\text {Pre }}=\frac{\sum\left(k W h_{\text {month }}\right)}{\left.{d a y s_{\text {pre }}}\right)} \times 365 \text { days } / y r \\
k W h_{\text {Post }}=\frac{\sum\left(k W h_{\text {month }}\right)}{\text { days }_{\text {post }}} \times 365 \text { days } / y r \\
\text { Adjusted } k W h_{\text {Pre }}=k W h_{\text {pre }} \times \frac{\text { Prod }_{\text {post }}}{\text { Prod }_{\text {pre }}} \\
k W_{\text {peak }}=\frac{\text { Annual Energy Savings }}{\text { Hours }}
\end{gathered}
$$

Where,
$k W h_{\text {Pre }}$ Average baseline annual energy usage, $\mathrm{kWh} / \mathrm{yr}$
$k W h_{\text {Post }}$ Estimated post annual energy usage, $\mathrm{kWh} / \mathrm{yr}$
Adjusted $k W h_{\text {Pre }} \quad$ Baseline annual energy usage adjusted for increase plant production, kWh/yr
$k W h_{\text {month }}$ BilLED kWh from utility bills for the pre and post time period, $\mathrm{kWh} / \mathrm{mo}$ days $_{\text {pre,post }}$ BilLED time period based on utility meter reading date, days
Prod $_{\text {pre }}$ Typical plant production rate before improved equipment, Ibs/day
Prod $_{\text {post }}$ Typical plant production rate after improved equipment, Ibs/day
HoursEstimated annual operating hours of the plant, hours/yr

Parameters specific to this site are listed below in Table A:
Table A, Savings Parameters

|  | Prod (Ib/day) | kWh/day | $\boldsymbol{k W h} / \boldsymbol{y r}$ | $\boldsymbol{k W}_{\text {peak }}$ |
| :---: | :---: | :---: | :---: | :---: |
| Pre | 1,187 | 294 | 157,580 | 26.26 |
| Post | 1,741 | 60 | 22,077 | 3.68 |

## Savings Calculations

Table B, Normalized kWh Savings Calculations

| Measure | $k W h /$ day |  | $k W h / y r$ |  | Expected <br> $k W h$ <br> Savings | Realized <br> $k W h$ <br> Savings | Realization <br> Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Pre | Post | Pre | Post |  |  |  |
| Process Improvement | 294 | 60 | 157,580 | 22,077 | 178,700 | 135,503 | $75.8 \%$ |
|  |  |  |  |  |  |  |  |

Table C, HVAC kW Savings Calculations

| Measure | $k W_{\text {peak }}$ |  | Expected <br> $k W$ <br> Savings | Realized <br> $k W$ <br> Savings | Realization <br> Rate |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Pre | Post |  |  |  |
| Process Improvement | 26.26 | 3.68 | 29.25 | 22.58 | $77.2 \%$ |
|  |  |  |  |  |  |

## Results

The kWh realization rate for Project 13 is $75.8 \%$ and the kW realization rate is $77.2 \%$.
Ex ante calculations only used four months of the utility data to estimate the baseline energy usage. instead of using all the available utility data without providing a reason for the exclusion. The utility data does not show large changes over time that could be related to increase in production rates. The four months included in the baseline contain two of the highest billed months which will overestimate the pre-installation annual energy consumption.

Table D, Verified Gross Savings \& Realization Rates

| Measure | Verified |  |  |  |
| ---: | :---: | :---: | :---: | :---: |
|  | kWh Savings | kW Savings | kWh <br> Realization <br> Rate | kW <br> Realization <br> Rate |
| Process Improvement | 135,503 | 22.58 | $75.8 \%$ | $77.2 \%$ |
| Total | 135,503 | 22.58 | $\mathbf{7 5 . 8 \%}$ | $\mathbf{7 7 . 2 \%}$ |

## Project Background

The participant is a junior high school that received incentives for retrofitting interior and exterior lighting, installing occupancy sensors to control portions of the newly-installed lighting and retrofitting existing air conditioners and heat pumps with more efficient units. On-site, the Evaluators verified the installation and operation of the following measures:

- (126)3' 1-Lamp T8 RLOs r replaced (126) 4' 1-Lamp T8s
- (1892)4' 2-Lamp T8 28W RLOs r replaced (1892) 4' 2-Lamp T8s
- (68)29W LED - Non-Int. ballasts r replaced (68) 100W metal halides
- (18)100W LED - Non-Int. ballasts r replaced (18) 400W metal halides
- (20)40W LED - Non-Int. ballasts $r$ replaced (20) 150W HPSs
- (32)91W LED - Non-Int. ballasts r replaced (32) 250W metal halides
- (4)10W LED - Non-Int. ballasts r replaced (4) 70W HPSs

Additionally, occupancy sensors were installed to control 236 of the newly-installed fixtures.

The site also replaced existing HVAC equipment with newer, more efficient units:

- (48) air conditioning units (totaling 240 tons)
- (14) heat pumps (totaling 61 tons)

On site, lighting operation schedules were also collected through staff interviews and photo-logging equipment was placed on site to monitor lighting operation.

## Calculation Parameters

Lighting savings calculations were performed using the methods section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{E}$ | IEFD | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Primary School <br> (classrooms) | Yes | 1,800 | 1.21 | 1.30 | $20 \%$ |
| Primary School <br> (non- <br> classrooms) | Yes | Custom, <br> varies by <br> area | 1.21 | 1.30 | $20 \%$ |

| Exterior | No | 4,313 | 1.00 | 1.00 | $0 \%$ |
| :--- | :--- | :--- | :--- | :--- | :--- |

HVAC savings calculations were performed using savings methodology described below incorporating deemed EFLH from the 2014 CA TRM and data gathered on site.

Annual Energy Savings $=\left(k W_{\text {Pre }}-k W_{\text {Post }}\right) \times$ EFLH

$$
\begin{aligned}
& k W_{\text {Pre }}=\frac{\text { Tonnage } \times 12}{E E R_{\text {Pre }}} \\
& k W_{\text {Post }}=\frac{\text { Tonnage } \times 12_{E E R_{\text {post }}}}{}
\end{aligned}
$$

Where,
$k W_{\text {Pre }}$ Baseline HVAC full load energy usage, kW
$k W_{\text {Post }}$ InstalLED HVAC full load energy usage, kW
$E E R_{\text {pre }}$ Baseline HVAC rated energy efficiency rating, BTUh/Watt
$E E R_{\text {Post }}$ InstalLED HVAC rated energy efficiency rating, BTUh/Watt
EFLHEstimated full load hours per year, hr/yr
TonnageTotal HVAC rated tonnage, tons 12Conversion factor BTUh to tons (12,000 :1) and W to kW (1,000 :1)

Parameters specific to this site are listed below in Table B:
Table B, Savings Parameters

| HVAC Type | EER $_{\text {Pre }}$ | EER $_{\text {Post }}$ | Tons | $\boldsymbol{k W}_{\text {Pre }}$ | $\boldsymbol{k} W_{\text {Post }}$ | $\boldsymbol{E F L H}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Package/Split | 9.4 | 12.0 | 61 | 77.9 | 61.0 | 1,267 |
| Heat Pump | 8.9 | 12.0 | 84 | 113.3 | 84.0 | 1,267 |

## Results

The kWh and kW realization rates for Project 14 are $78.1 \%$ and $50.0 \%$, respectively.
Ex ante calculations assumed classroom lighting operated 1,800 hours annually, and occupancy sensors would decrease this by $28 \%$ to 1,296 . The 2014 CA TRM recommends an 18\% reduction for classrooms for wall or ceiling-mounted occupancy sensors, so the Evaluators revised the reduction in hours to $18 \%$. This resulted in 1,455 post-sensor retrofit AOH for several classrooms, slightly lowering lighting kWh realization. Additionally, all exterior retrofits assumed 4,380 AOH, however this was adjusted to 4,313 to match the IID territory NDH, further reducing the realized kWh. Calculations for 24 previously-installed 18W CFLs assumed 20W per lamp, which was corrected to 18W in ex post calculations. Ex ante calculations did not use interactive energy or demand factors to account for the reduced load on the HVAC system because of the more efficient lighting. Accounting for these in ex post calculations increased both kWh and peak kW realized savings. Finally, all ex ante kW reduction calculations assumed a 100\% peak coincidence factor for interior and exterior lighting. The Evaluators adjusted this factor to $2 \%$ for interior lighting and 0\% for exterior lighting, in accordance with deemed TRM specifications for secondary schools, causing the low lighting kW realization rate.

The EFLHc value used in ex ante savings calculations is 2,883 , which would reflect continuous operation of all units for approximately 13.8 hours per day for all school days during the school year. This EFLHc was adjusted to 1,267 based on the cooling EFLHc from the New Mexico TRM for a primary school in Las Cruces, NM, which is in the same ASHRAE climate zone as this school.

Program CESP 2015

## Project Background

The participant is a department store that received incentives from IID for retrofitting existing lighting with energy efficient lighting. On-site, the Evaluators verified the installation and operation of the following measures:

- (156) 4' 2-lamp T8 reduced output fixtures replaced (156) 4' 4-lamp T8 fixtures ;
- (85) 4' 1-lamp T8 28ws replaced (85) 4' 2-lamp T8 30w fixtures;
- (897) 36w LED - non-int. ballasts replaced (897) 4' 3-lamp T8 fixtures;
- (9) 18 w LED - non-int. ballasts replaced (9) 4' 2-lamp T8 fixtures
- (143) 3' 1-lamp T8 reduced output fixtures replaced (143) 3' 2-lamp T8 fixtures ;
- (34) 13w CFLs replaced (34) 13w cfl fixtures;
- (2) 4' 2-lamp T8 reduced output fixtures replaced (2) 4' 3-lamp T8 fixtures;
- (2) 4' 3-lamp T8 30ws replaced (2) 4' 3-lamp T8 fixtures;
- (31) 4' 2-lamp T8 reduced output fixtures replaced (31) 4' 3-lamp T8 fixtures;
- (9) 2' 2-lamp T8 reduced output fixtures replaced (9) 4' 2-lamp T8 fixtures; and
- (81) 3' 1-lamp T8 reduced output fixtures replaced (81) 3' 4-lamp T8s.

On site, lighting operation schedules were also collected through staff interviews.

## Calculation Parameters

Savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{\boldsymbol{E}}$ | IEF $_{\boldsymbol{D}}$ | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Department Store: <br> Stockrooms | Yes | 5,700 | 1.24 | 1.17 | $76 \%$ |

| Department Store: <br> Offices, Spot Lighting, <br> Main store | Yes | 5,100 | 1.24 | 1.17 | $76 \%$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Department: Alternative <br> Stockroom | Yes | 4,080 | 1.24 | 1.17 | $76 \%$ |
| Department: Fitting <br> Room | Yes | 5,700 | 1.24 | 1.17 | $76 \%$ |

## Results

The kWh realization rate for Project 15 is $117.9 \%$ and the kW realization rate is $139.0 \%$.
Fitting room hours were adjusted from 4,380 to 5,100. Ex ante calculations did not include the reduced load on the HVAC system as a result of the more efficient lighting as a result of the more efficient lighting. These factors increased both kWh and kW savings. Additionally, while final ex ante kWh figures were calculated using appropriate AOH per space, the kW was calculated from kWh figures which all used the same lighting hours of operation $(5,100)$. This underestimated the kW savings slightly as actual hours varied by area of the store. Ex post kW savings were calculated per line item, resulting in higher kW savings.

Program CESP 2014

## Project Background

The participant is a department store that received incentives from IID for implementing energy efficient lighting on its sales floor in and back offices. On-site, the Evaluators verified the installation and operation of the following measures:

- (1087) 44w LED - non-int. ballasts replaced (1087) 4' 4-lamp T8s.

On site, lighting operation schedules were also collected through staff interviews and photo-logging equipment was placed on site to monitor lighting operation.

## Calculation Parameters

Savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{E}$ | IEF | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Department <br> Store (floor) | Yes | 5,078 | 1.17 | 1.24 | $100 \%$ <br> 21 |
| Department <br> Store (offices) | Yes | 5,241 | 1.17 | 1.24 | $100 \%^{1}$ |

[^15]
## Savings Calculations

Table B, Lighting Retrofit kWh Savings Calculations

| Measure | Quantity <br> (Fixtures) |  | Wattage |  |  | Expected <br> $k W h$ | Realized <br> $k W h$ <br> Savings | IEF $F_{E}$ | Realization <br> Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| F32T8 to LED44W | 950 | 950 | 112 | 44 | 5,078 |  | 383,803 | 1.17 | N/A |
| F32T8 to LED44W | 137 | 137 | 112 | 44 | 5,241 |  | 57,121 | 1.17 | N/A |

Table C, Lighting Retrofit kW Savings Calculations

| Measure | Quantity (Fixtures) |  | Wattage |  | CF | Expected <br> kW <br> Savings | Realized kW <br> Savings | $I E F_{D}$ | Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| F32T8 to LED44W | 950 | 950 | 112 | 44 | 1.00 |  | 80.10 | 1.24 | N/A |
| F32T8 to LED44W | 137 | 137 | 112 | 44 | 1.00 |  | 11.55 | 1.24 | N/A |
|  |  |  |  |  | Total | 73.92 | 80.10 |  | 108.4\% |

## Results

The kWh realization rate for Project 16 is $94.4 \%$ and the kW realization rate is $108.4 \% \%$.
Ex ante calculations were premised on higher annual lighting operation hours $(5,500)$ than those recorded by photo logging equipment left on site (5,078 for the sales floor and 5,241 for the back offices). Logged lighting also reflects lighting hours of operation calculated by posted store hours. Ex ante calculation did not include the reduced load on the HVAC system as a result of the more efficient lighting as a result of the more efficient lighting. These factors increased both kWh and kW savings.

|  | kWh Savings | kW Savings | kWh <br> Realization <br> Rate | kW <br> Realization <br> Rate |
| F32T8 to LED44W | 383,803 | 80.10 | $94.4 \%$ | $108.4 \%$ |
| Total | $\mathbf{3 8 3 , 8 0 3}$ | $\mathbf{8 0 . 1 0}$ | $\mathbf{9 4 . 4 \%}$ | $\mathbf{1 0 8 . 4 \%}$ |

## Project Background

The participant is a high school that received incentives for retrofitting interior and exterior lighting, installing occupancy sensors to control portions of the newly-installed lighting and retrofitting existing air conditioners and heat pumps with more efficient units. On-site, the Evaluators verified the installation and operation of the following measures:

- (82) 4' 2-Lamp T8 28Ws replaced (82) 4' 1-Lamp T8s
- (234) 4' 3-Lamp T8 28W RLOs replaced (234) 4' 1-Lamp T8s
- (56) 135W LED - Non-Int. ballasts replaced (56) 250W metal halides
- (1205) 4' 2-Lamp T8 28W RLOs replaced (1205) 2' 4-Lamp T8s
- (28) 20W LED - Non-Int. ballasts replaced (28) 70W HPSs
- (2) 4' 1-Lamp T8 28W RLOs replaced (2) 4' 1-Lamp T8s
- (2) 155W LED - Non-Int. ballasts replaced (2) 400W metal halides
- (12) 30W LED - Non-Int. ballasts replaced (12) 175W metal halides
- (25) 40W LED - Non-Int. ballasts replaced (25) 150W HPSs
- (7) 100W LED - Non-Int. ballasts replaced (7) 400W metal halides
- (1) 100W LED - Non-Int. ballasts replaced (2) 1000W metal halides
- (1) 2' 4-lamp T8s replaced (1) 42W CFLs
- (31) 40W LED - Non-Int. ballasts replaced (31) 175W metal halides
- (14) 223 W LED fixtures replaced (28) 1000W metal halides
- (276) 4' 3-Lamp T8 28W RLOs replaced (276) 4' 4-Lamp T8s
- (42) 223 W LED fixtures replaced (42) 400W metal halides
- (146) 4' 2-Lamp T8 28W RLOs replaced (146) 4' 4-Lamp T8s
- (41) 4' 2-Lamp T8 28W RLOs replaced (41) 4' 1-Lamp T8s
- (5) 10W LED - Non-Int. ballasts replaced (5) 70W HPSs
- (30) 10W LED - Non-Int. ballasts replaced (30) 18W CFLs

Additionally, occupancy sensors were installed to control 2,272 of the newly-installed fixtures.
The site also replaced existing HVAC equipment with newer, more efficient units:

- (15) air conditioning units (totaling 61 tons)
- (20) heat pumps (totaling 84 tons)

On site, lighting operation schedules were also collected through staff interviews and photo-logging equipment was placed on site to monitor lighting operation.

## Calculation Parameters

Lighting savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEFE $_{E}$ | IEFD | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Secondary <br> School <br> (classrooms) | Yes | 1,800 | 1.21 | 1.30 | $20 \%$ |
| Secondary <br> School (non- <br> classrooms) | Yes | Custom, <br> varies by <br> area | 1.21 | 1.30 | $20 \%$ |
| Exterior | No | 4,313 | 1.00 | 1.00 | $0 \%$ |

HVAC savings calculations were performed using savings methodology described below incorporating deemed EFLH from the 2014 CA TRM and data gathered on site.

$$
\begin{gathered}
\text { Annual Energy Savings }=\left(k W_{\text {Pre }}-k W_{\text {Post }}\right) \times E F L H \\
k W_{\text {Pre }}=\frac{\text { Tonnage } \times 12}{E E R_{\text {Pre }}} \\
k W_{\text {Post }}=\frac{\text { Tonnage } \times 12}{E E R_{\text {post }}}
\end{gathered}
$$

Where, $k W_{\text {Pre }}$ Baseline HVAC full load energy usage, kW $k W_{\text {Post }}$ InstalLED HVAC full load energy usage, kW
$E E R_{\text {pre }}$ Baseline HVAC rated energy efficiency rating, BTUh/Watt
$E E R_{\text {Post }}$ InstalLED HVAC rated energy efficiency rating, BTUh/Watt
EFLHEstimated full load hours per year, hr/yr
TonnageTotal HVAC rated tonnage, tons
12Conversion factor BTUh to tons (12,000:1) and W to kW (1,000 :1)

Savings parameters used are shown in Savings calculations were performed using the methods described in section X.Y.Z. of this report. Parameters specific to this site are listed below in Table B:

Table B, Savings Parameters

| HVAC Type | EER $_{\text {Pre }}$ | EER $_{\text {Post }}$ | Tons | $\boldsymbol{k W}_{\text {Pre }}$ | $\boldsymbol{k W}_{\text {Post }}$ | $\boldsymbol{E F L H}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Package/Split | 9.4 | 12.0 | 61 | 77.9 | 61.0 | 1,267 |
| Heat Pump | 8.9 | 12.0 | 84 | 113.3 | 84.0 | 1,267 |

## Savings Calculations

## Results

The kWh and kW realization rates for Project 17 are $87.6 \%$ and $1.5 \%$, respectively.
Ex ante calculations assumed classroom lighting operated 1,800 hours annually and occupancy sensors would decrease this by $28 \%$ to 1,296. The 2014 CA TRM recommends an 18\% reduction for classrooms for wall or ceiling-mounted occupancy sensors, so the Evaluators revised the reduction in hours to 18\%. This resulted in 1,455 post-sensor retrofit AOH for the majority of the classrooms, slightly lowering lighting kWh realization. Offices and administrative areas were also assumed to have a $28 \%$ reduction in operating hours due to occupancy sensors, but this was changed to $22 \%$ for the same reasons classroom hours were changed. These both contributed to lower lighting kWh realization. Additionally, all exterior retrofits assumed $4,380 \mathrm{AOH}$, however this was adjusted to 4,313 to match the IID territory NDH, further reducing the realized kWh. Calculations for 88 previously-installed 18W CFLs assumed 20W per lamp, which was corrected to 18 W in ex post calculations. Ex ante calculations did not use interactive energy or demand factors to account for the reduced load on the HVAC system because of the more efficient lighting. Accounting for these in ex post calculations increased both kWh and peak kW realized savings. Finally, all ex ante kW reduction calculations assumed a 100\% peak coincidence factor for interior and exterior lighting. The Evaluators adjusted this factor to $2 \%$ for interior lighting and $0 \%$ for exterior lighting, in accordance with deemed TRM specifications for secondary schools, causing the low lighting kW realization rate.

Ex ante HVAC calculations specified a 11.1 EER value for newly-installed equipment. The Evaluators verified nameplate information gathered during the on-site visits and found the EER values of the new equipment to be 12.0 according to the manufacture's specifications. Additionally, the EFLHc value used in ex ante savings calculations is 2,883 , which would reflect continuous operation of all units for approximately 13.8 hours per day for all school days during the school year. This EFLHc was adjusted to 1,267 based on the cooling EFLHc from the New Mexico TRM for a primary school in Las Cruces, NM, which is in the same ASHRAE climate zone as this school.

Table G, Verified Gross Savings \& Realization Rates

| Measure | Verified |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | kWh Savings | kW Savings | kWh <br> Realization <br> Rate | kW <br> Realization <br> Rate |

| HVAC | 58,448 | 0.46 | $60.0 \%$ | $134.2 \%$ |
|  | Total | 531,826 | $\mathbf{3 . 8 5}$ | $\mathbf{8 7 . 6 \%}$ |

## Project Background

The participant is an indoor amusement center that received incentives from IID for retrofitting existing lighting with energy efficient lighting and upgrading ceiling insulation. On-site, the Evaluators verified the installation and operation of the following measures:

- (175) 4' 4-lamp T8s replaced (265) 400w metal halides;
- (150) LED - non-int. ballast tubes replaced (265) 400w metal halides.
- Ceiling insulation upgrades from R-19 to R-30

Lighting operation schedules were also collected through staff interviews to determine AOH .

## Calculation Parameters

Lighting savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{E}$ | IEF $_{\boldsymbol{D}}$ | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Conditioned <br> Storage | Yes | 4,589 | 1.11 | 1.30 | $100 \%$ <br> 22 |

The Evaluators obtained the original Energy Pro models used to develop savings estimates for the increased ceiling insulation in the facility. The model design and inputs were reviewed.

## Savings Calculations

Table B, Lighting Retrofit kWh Savings Calculations

| Measure | Quantity <br> (Fixtures) |  | Wattage |  | AOH | Expected <br> $k W h$ <br> Savings | Realized <br> $k W h$ <br> Savings | IEFFE | Realization <br> Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| MH400 to F32T8 | 265 | 175 | 429 | 109 | 4,589 | 421,678 | 482,057 | 1.11 | $114.3 \%$ |
| MH400 to LED54W | 265 | 150 | 429 | 54 | 4,589 | 371,238 | 537,778 | 1.11 | $144.9 \%$ |

Table C, Lighting Retrofit kW Savings Calculations

| Measure | Quantity (Fixtures) |  | Wattage |  | CF | Expected <br> kW <br> Savings | Realized kW Savings | $I E F_{D}$ | Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| MH400 to F32T8 | 265 | 175 | 429 | 109 | 1.00 | 83.60 | 123.04 | 1.30 | 147.2\% |
| MH400 to LED54W | 265 | 150 | 429 | 54 | 1.00 | 73.60 | 137.26 | 1.30 | 186.5\% |
|  |  |  |  |  | Total | 157.20 | 260.30 |  | 165.6\% |

## Results

The kWh realization rate for Project 18 is $127.7 \%$ and the kW realization rate is $159.5 \%$.
Ex ante calculations assumed 5,044 annual lighting hours of operation, but on site the Evaluators found that the facility lighting operated only 4,589 hours annually, decreasing the kWh realization rate. However, Ex ante calculations did not include ballast factors for either pre or post-retrofit lighting, or the reduced load on the HVAC system as a result of the more efficient lighting as a result of the more efficient lighting. Ex post calculations included these, raising both the kWh and kW realization rates.

Table D, Verified Gross Savings \& Realization Rates

| Measure | Verified |  |  |  |

Program CESP 2015

## Project Background

The participant is a casino and hotel that received incentives from IID for retrofitting existing lighting with energy efficient lighting. On-site, the Evaluators verified the installation and operation of the following measures:

- (925) $10 w$ LED - non-int. ballasts replaced (925) $65 w$ incandescent fixtures;
- (44) $8 w$ LED - non-int. ballasts replaced (44) 30w incandescent fixtures;
- (200) 7 w LED - non-int. ballasts replaced (200) 35w 1-lamp halogens;
- (84) 100 w LED - non-int. ballasts replaced (84) 400w metal halides;
- (135) 17w LED - non-int. ballasts replaced (135) 4' 2-lamp T8s;
- (65) 17 w LED - non-int. ballasts replaced (65) 4' 2-lamp T8s;
- (138) 50w LED - non-int. ballasts replaced (138) 250w metal halides;
- (60) 17 w LED - non-int. ballasts replaced (60) 100 w metal halides; and
- (15) 150 w LED - non-int. ballasts replaced (15) 400 w metal halides.

Lighting operation schedules were also collected through staff interviews to determine AOH .

## Calculation Parameters

Savings calculations were performed using the methods described section 2.2.2. of this report. Parameters specific to this site are listed below in Table A:

Table A, Savings Parameters

| Space Type | Air <br> Conditioned | Annual <br> Hours | IEF $_{E}$ | IEF $_{\boldsymbol{D}}$ | CF |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Hotel | Yes | 8,760 | 1.16 | 1.29 | $100 \%$ |
| Hotel | Yes | 2,928 | 1.16 | 1.29 | $24 \%$ |
| Exterior | None | 4,313 | 1.00 | 1.00 | $0 \%$ |

## Savings Calculations

Table B, Lighting Retrofit kWh Savings Calculations

| Measure | Quantity (Fixtures) |  | Wattage |  | AOH | Expected <br> kWh <br> Savings | Realized <br> kWh <br> Savings | $I E F_{E}$ | Realization Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| I65 to LED10W | 925 | 925 | 65 | 10 | 8,760 | 445,665 | 516,971 | 1.16 | 116.0\% |
| 130 to LED8W | 44 | 44 | 30 | 8 | 8,760 | 8,480 | 9,836 | 1.16 | 116.0\% |
| H35 to LED7W | 200 | 200 | 35 | 7 | 8,760 | 49,056 | 56,905 | 1.16 | 116.0\% |
| MH400 to LED100W | 84 | 84 | 450 | 100 | 2,928 | 86,083 | 99,857 | 1.16 | 116.0\% |
| F32T8 to LED17W | 135 | 135 | 64 | 17 | 8,760 | 27,791 | 64,475 | 1.16 | 232.0\% |
| F32T8 to LED17W | 65 | 65 | 64 | 17 | 8,760 | 26,762 | 31,044 | 1.16 | 116.0\% |
| MH250 to LED50W | 138 | 138 | 275 | 50 | 8,760 | 135,999 | 315,518 | 1.16 | 232.0\% |
| MH100 to LED17W | 60 | 60 | 110 | 17 | 4,313 | 24,440 | 24,067 | 1.00 | 98.5\% |
| MH400 to LED150W | 15 | 15 | 458 | 150 | 4,313 | 20,236 | 19,926 | 1.00 | 98.5\% |
|  |  |  |  |  | Total | 824,512 | 1,138,599 |  | 138.1\% |

Table C, Lighting Retrofit kW Savings Calculations

| Measure | Quantity <br> (Fixtures) |  | Wattage |  | CF | Expected <br> kW <br> Savings | Realized <br> kW <br> Savings | IEF | Realization <br> Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Base | Post | Base | Post |  |  |  |  |  |
| I65 to LED10W | 925 | 925 | 65 | 10 | 1.00 | 50.88 | 65.63 | 1.29 | $129.0 \%$ |
| I30 to LED8W | 44 | 44 | 30 | 8 | 1.00 | 0.97 | 1.25 | 1.29 | $128.9 \%$ |
| H35 to LED7W | 200 | 200 | 35 | 7 | 1.00 | 5.60 | 7.22 | 1.29 | $128.9 \%$ |
| MH400 to LED100W | 84 | 84 | 450 | 100 | 0.24 | 9.83 | 9.10 | 1.29 | $92.6 \%$ |
| F32T8 to LED17W | 135 | 135 | 64 | 17 | 1.00 | 3.17 | 8.19 | 1.29 | $258.4 \%$ |
| F32T8 to LED17W | 65 | 65 | 64 | 17 | 1.00 | 3.06 | 3.94 | 1.29 | $128.8 \%$ |

| MH250 to LED50W | 138 | 138 | 275 | 50 | 1.00 | 15.53 | 40.05 | 1.29 | $257.9 \%$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MH100 to LED17W | 60 | 60 | 110 | 17 | 0.00 | 2.79 | 0.00 | 1.00 | $0.0 \%$ |
| MH400 to LED150W | 15 | 15 | 458 | 150 | 0.00 | 2.31 | 0.00 | 1.00 | $0.0 \%$ |
| Total |  |  |  |  |  |  |  | $\mathbf{9 4 . 1 4}$ | $\mathbf{1 3 5 . 3 8}$ |

## Results

The kWh realization rate for Project 19 is $138.1 \%$ and the kW realization rate is $143.8 \%$.
Ex ante calculations assumed lights in two areas operated 4,380 hours annually, however on site the Evaluators determined that these lights operated continuously $(8,760)$. Ex ante calculations did not account for the reduced load on the HVAC system as a result of the more efficient lighting. Accounting for this increased both kWh and peak kW savings. Despite area type and annual lighting hours of operation, all areas were assumed to have a peak coincidence factor Of $100 \%$, however this was adjusted to $24 \%$ for one area and $0 \%$ for the exterior to account for verified hours of operation. This slightly reduced realized kW savings.

Table D, Verified Gross Savings \& Realization Rates

| Measure | Verified |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | kWh Savings | kW Savings | kWh <br> Realization <br> Rate | kW <br> Realization <br> Rate |
| I65 to LED10W | 516,971 | 65.63 | $116.0 \%$ | $129.0 \%$ |
| I30 to LED8W | 9,836 | 1.25 | $116.0 \%$ | $128.9 \%$ |
| H35 to LED7W | 56,905 | 7.22 | $116.0 \%$ | $128.9 \%$ |
| MH400 to LED100W | 99,857 | 9.10 | $116.0 \%$ | $92.6 \%$ |
| F32T8 to LED17W | 64,475 | 8.19 | $232.0 \%$ | $258.4 \%$ |
| F32T8 to LED17W | 31,044 | 3.94 | $116.0 \%$ | $128.8 \%$ |
| MH250 to LED50W | 315,518 | 40.05 | $232.0 \%$ | $257.9 \%$ |
| MH100 to LED17W | 24,067 | 0.00 | $98.5 \%$ | $0.0 \%$ |
| MH400 to LED150W | 19,926 | 0.00 | $98.5 \%$ | $0.0 \%$ |
|  |  | $1,138,599$ | 135.38 | $138.1 \%$ |

[^1]:    3 Values used in this evaluation come from the TRM, Section 4 "Common Default Factors". http://cmua.org/wpcmua/wp-content/uploads/2016/06/2016-CMUA-POU-TRM_Final_v692016.pdf Tables 4-3 to 48.
    ${ }^{4}$ Values used in this evaluation come from primary on site data collection, calculation based on verified operating hours, non-daylight hours calculated using sunrise/sunset times retrieved from the US Naval Observatory: http://aa.usno.navy.mil/data/docs/RS_OneYear.php In the event AOH could not be obtained from any of thee sources, deemed hours by space type from the TRM were used. http://cmua.org/wpcmua/wp-content/uploads/2016/06/2016-CMUA-POU-TRM_Final_v692016.pdf Tables 4-5.

[^2]:    *Appliance recycling measures were part of the 2014 Energy Rewards Program however, their savings are discussed separately in Section 4, Refrigerator Recycling. They are shown here for illustrative purposes.

[^3]:    ${ }^{5} 2014$ expected and realized savings numbers do not contain savings from refrigerator or freezer recycling, which are discussed in the following report chapter.

[^4]:    ${ }^{6}$ As of May 2017, less than $1 \%$ of ENERGY STAR Certified lamps were CFLs.

[^5]:    ${ }^{7}$ These savings estimates are from refrigerator and freezer recycling measures as part of 2014 Energy Rewards program.

[^6]:    ${ }^{8,2}$ ASHRAE Fundamentals 2009, Chapter 1: Psychometrics, Equation 11, Equation 41, Table 2

[^7]:    ${ }^{10}$ Average of Department of Energy minimum allowed HSPF for new heat pumps from 1992-2006 (6.8 HSPF) and after January 23, 2006 (7.7 HSPF)
    ${ }^{11}$ The Air Conditioning Contractors of America (ACCA) Manual S recommends that residential HVAC systems be sized at $115 \%$ of the maximum cooling requirement of the house. Assuming that the house's maximum cooling occurs during the hours 3 to 6 pm , this sizing guideline leads to a coincidence factor for residential HVAC of 1.0/1.15 = 0.87.
